1. The first step is to identify the problem. In this case, the problem is that the system is not working properly.

2. The next step is to gather information about the problem. This includes checking the logs, looking at the configuration files, and talking to the users who are reporting the problem.

3. Once you have gathered information, you can start to troubleshoot the problem. This involves testing different hypotheses and seeing if they solve the problem.

4. If you are unable to solve the problem, you may need to escalate it to a higher level of support. This could be a senior engineer or a manager.

5. Finally, once the problem is solved, you should document the solution so that it can be used in the future.
