1. DNA: The Genetic Material
 - DNA (deoxyribonucleic acid) is the genetic material that holds the instructions for life.
 - It is a long, thin molecule made of repeating units called nucleotides.
 - Nucleotides consist of a sugar (deoxyribose), a phosphate group, and a nitrogenous base (Adenine, Thymine, Guanine, or Cytosine).
 - DNA contains the genetic instructions necessary for the growth, development, functioning, and reproduction of organisms.
2. Replication of DNA
 - DNA replication is the process by which a cell makes an identical copy of its DNA.
 - It occurs during the S phase of the cell cycle.
 - The process is semi-conservative, meaning each new DNA molecule consists of one original (parental) and one newly synthesized strand.
 - Synthesis of DNA happens around and separates the DNA strands, which DNA polymerase adds complementary nucleotides to each strand.
 - The result is two identical DNA molecules, each containing one original strand and one newly synthesized strand.
3. RNA: mRNA, tRNA, and rRNA
 - RNA serves as the template for the synthesis of DNA instructions within a protein-coding sequence.
 - RNA is single-stranded and contains ribose sugar instead of deoxyribose.
 - There are three main types of RNA: messenger RNA (mRNA), transfer RNA (tRNA), and ribosomal RNA (rRNA).
 - mRNA carries the genetic information from DNA to the ribosome, where proteins are synthesized.
 - tRNA transfers amino acids to the ribosome during protein synthesis. It acts as the information carrier for tRNA.
 - rRNA is the structural component of ribosomes.
4. Gene Expression and Regulation
 - Gene expression is the process by which information from a gene is used to create a functional product, such as a protein.
 - Gene regulation is the control of gene expression.
 - Some organisms have mechanisms to control gene expression, such as the lac operon in bacteria.
 - Mutations in regulatory regions can lead to genetic disorders or diseases.
