Antagonistic: Two drugs taken together = decreased effectiveness of both

Potentialistic: One drug's potency is enhanced when combined with another

Absorption: One drug affects absorption rate of another

Metabolism: One drug affects metabolism of another; if inhibited, can cause toxicity

Adverse Reactions

Caused by Patient Sensitivity

Allergic/anaphylactic reaction
Idiosyncratic response

Caused by Dose

Secondary/side effects

ROUTES OF ADMINISTRATION

Oral: Capsule, tablet, liquid; absorbed in GI tract

Intravenous (IV): Injection into bloodstream via vein

Intramuscular (IM): Injection into muscle; can use large doses; fast systemic action

Intrathecal: Injection into spinal canal; affects spinal fluid

Subcutaneous (sub-Q): Injection into tissue below dermis

Sublingual: Absorbed under the tongue

Rectal/vaginal: Suppositories or creams; usually for local distribution

Inhalation: Absorbed in lungs; gaseous form; rapid absorption

PHARMACOLOGY BASICS

Pharmacokinetics: Study of drugs' actions as they move through the body

Absorption: Affected by administration route, formulation, patient stress level or stomach contents, blood flow

Distribution: Affected by solubility, protein activity, blood flow

Metabolism: Affected by diseases, environment, age, genetics

Excretion: Through kidneys, skin, intestines, lungs, exocrine glands

Pharmacodynamics: Study of the mechanism of action of drugs within the body and how drugs produce their effects in the body

Pharmacotherapeutics: Study of drugs used to prevent, treat, or diagnose disease

CONSIDERATIONS ACROSS THE LIFESPAN

Pregnant/Breastfeeding Women

- Renal excretion rate and hepatic metabolism are accelerated = consider higher dosages
- Intestinal excretion rate decreased = longer absorption time = consider reduced dosages
- Assume all drugs can enter the fetus via placenta
- Consult FDA risk categories for every drug before considering administration
- Weeks 3-8 present greatest risk of drug-induced malformation of fetus
- After pregnancy, doses should be taken directly after breastfeeding to ensure minimal drug concentration in breast milk for next feeding

Pediatric Patients

- Assume increased drug sensitivity due to immature organ system
- Infants have irregular gastric patterns = absorption rates may vary
- Infants/young children have thin skin = rapid topical drug absorption
- Infants' blood-brain barrier not fully developed = increased sensitivity to CNS drugs, risk of toxicity
- Neonates absorb IM drugs slower than adults; infants absorb IM drugs faster
- Infants have reduced protein-binding ability = high free concentrations of drugs
- Liver and kidneys not fully developed until after 1 year of life; assume reduced ability for hepatic and renal metabolism in infants
- In children over 1 year of age, drug metabolism rate is higher than adults
- Children may have unique side effects to certain drugs, including suppressed growth
- General rule for dosing adjustment:
Body surface area of child x Adult dose = approx. dose for child
1.73 m²
- Patient education should include instructions for how to account for spitting or spilling of medication, avoiding multiple dosing

Geriatric Patients

- Assume increased drug sensitivity due to deteriorated organ system
- Reactions vary greatly based on individual patient condition
- Rate of absorption generally slowed = delayed therapeutic response
- Hepatic metabolism rate likely slowed = longer therapeutic response
- Renal excretion slowed = accumulation of drug, increased risk of adverse effects
- Determine creatinine clearance prior to drug administration to assess renal function
- Intentional failure to follow prescribed regimen a common problem; longer or more extensive patient education may be required
- Anticipate, assess, and/or manage drug interactions carefully
