

Water cycle:

Closed system: inputs and outputs are **balanced**. There's a transfer of energy but not matter between the systems and its surroundings. Inputs come from within the system. → The Global Hydrological Cycle is a closed system driven by solar energy and gravitational potential energy.

Open system: receives inputs from and transfers output of energy and matter to other systems.

Stores: reservoirs where **water is held** → oceans

Fluxes: The **rate of flows** between the stores → low flux in arctic

Processes: the **physical mechanisms** that drive the fluxes of water between the stores

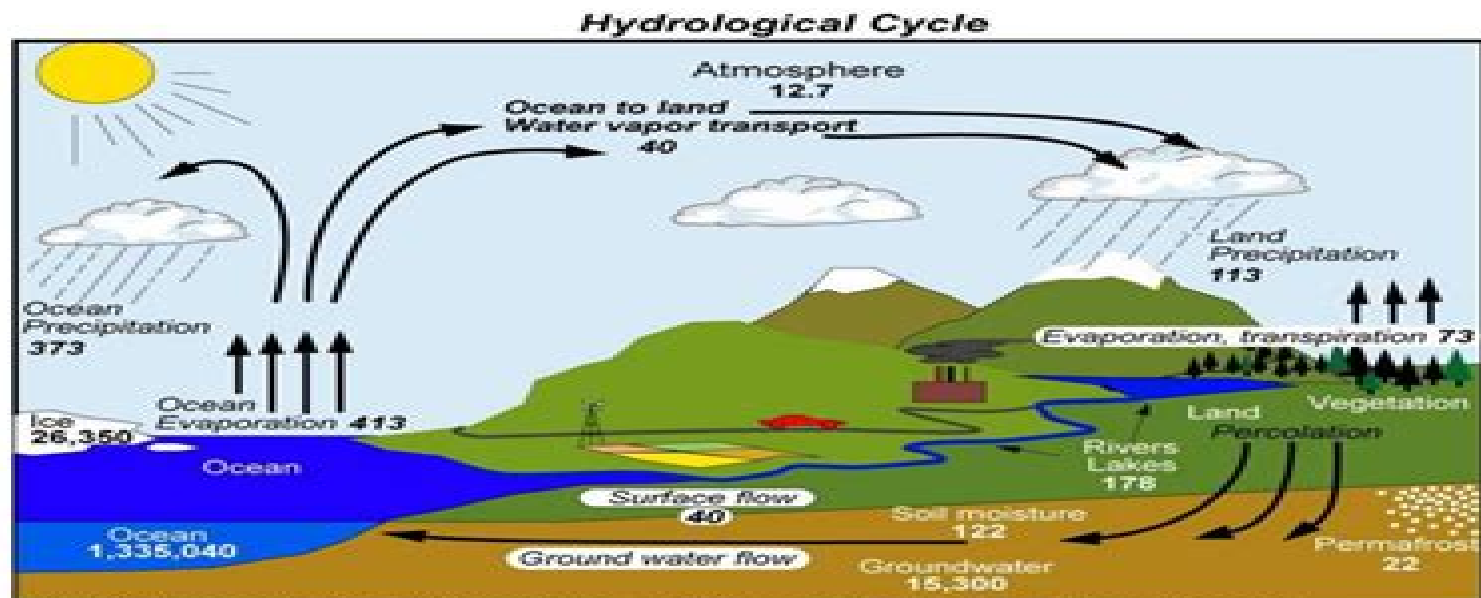

Cryosphere: Areas of the Earth where **water is frozen into snow or ice**

Blue Water: Water is **stored in rivers, streams, lakes and groundwater** in liquid form

Green Water: Water **stored in the soil and vegetation** (the invisible part of the hydrological cycle)

There's a water imbalance around the world → there are 2 types of water on earth Freshwater (drinkable) and Saline Water (held in oceans). Only 2.5% of the world's water is Freshwater so 97.5% of the world's water is stored in oceans and is not drinkable. The two main stores of total global water are oceans and freshwater stores. The two largest stores of global Freshwater are Glaciers/ Ice Caps and Groundwater. The percentage of Global Water in Glaciers and ice-caps is 1.72%

When analysing the hydrological cycle we take a **systems approach** → look at the balance between outputs, inputs and how the water is moved between stores by flows (fluxes are the rate of flows)
