Molecular and Cellular Aspects of the Serpinopathies and Disorders in Serpin Activity Gary A. Silverman,David A. Lomas,2007

Serpins constitute a superfamily of proteins that possess a unique tertiary structure and mechanism of proteinase inhibition In humans serpins constitute 10% of the plasma proteins and are best known as critical regulators of both the thrombotic and fibrinolytic systems Serpins also participate in the regulation of the complement cascade angiogenesis tumor metastasis apoptosis and innate immunity Considering the importance of these molecules in regulating proteolytic cascades it is not surprising to find that loss and gain of function mutations result in significant human diseases Massive thrombosis or bleeding hereditary angioedema Alzheimer s disease diabetic angiopathy and tumor invasion are some of the human diseases associated with serpins In addition mutations that alter serpin conformations the serpinopathies lead to lung disease cirrhosis and a form of familial dementia The goal of this text is to present the current knowledge on the molecular and cellular basis of serpins and their diseases

Tribute to Professor Toshiharu Nagatsu M. Naoi, W. Maruyama, M.A. Collins, M B H Youdim, S. Hasan Parvez, 2002-09-25

This book summarizes recent advances in understanding the mechanism underlying the selective cell death of dopamine neurons in Parkinson's disease. MPTP, endogenous neurotoxins, L-DOPA and metal were proved to induce apoptosis and necrosis in neurons. The relationship of these causal factors to the pathogenesis of Parkinson's disease was discussed to give us overviews on the role of neurotoxins in this degenerative disorder. This title further presents the intracellular signal transduction and the related enzymes and other factors involved in dopaminergic neuronal death. Recent results on intracellular mechanism of neuroprotection are presented suggesting that neuroprotection as a causal therapy of neurodegenerative disorders may become practical in near future. This book shows new neuroprotective agents such as propargylamine derivatives and neurotrophins and the intracellular mechanism to prevent the activation of apoptotic cascade in neurons. The authors of this book are active researchers participating in these subjects and the readers will find the knowledge and techniques for the study on neurotoxicity and neuroprotection and the strategy for future research on these important subjects in clinical and basic neurology and neurosciences. The book is dedicated to Professor Toshiharu Nagatsu, a pioneer in the search for pathogenic factors in Parkinson's disease. The book is reprinted from the journal *Neurotoxicology and Teratology* Volume 24/5.

Developing Therapeutics for Alzheimer's Disease Michael S. Wolfe, 2016-05-27

Developing Therapeutics for Alzheimer's Disease: Progress and Challenges provides a thorough overview of the latest advances toward the development of therapeutics for Alzheimer's disease along with the major hurdles that still must be overcome and potential solutions to these problems. Despite the lack of progress toward developing therapeutics that can slow or stop the progression of this disease, important discoveries have been made and many promising approaches are advancing in preclinical studies and clinical trials. This book outlines the special challenges related to specific targets and approaches while presenting a realistic, comprehensive and balanced view of drug discovery and development in this area. Written by international leaders in the field, the book assesses prospects for the emergence of effective agents and allows readers to better understand the challenges, failures and future potential for research in Alzheimer's disease. This book is a valuable resource to academic scientists carrying out translational research in Alzheimer's disease, industrial scientists engaged in Alzheimer's drug discovery, executives in biopharmaceutical companies making strategic decisions regarding the direction of internal research and potential outside partnerships, and graduate level students pursuing courses on Alzheimer's therapeutics. Provides a realistic but promising assessment of the potential of various therapeutic approaches to Alzheimer's disease. Focuses primarily on neuroprotective agents and cognitive enhancers as well as approaches to targeting the amyloid β peptide, tau and Apolipoprotein E. Discusses alternative approaches, preclinical and clinical development issues, related biomarkers and diagnostics, and prevention and nonpharmacological approaches.

Phylogenetic Perspectives on the Vertebrate

Immune System Gregory Becker, Manickam Sugumaran, Edwin L. Cooper, 2012-12-06 This book contains the proceedings of the first meeting on invertebrate immunity ever sponsored as a summer research conference by the Federation of American Societies for Experimental Biology FASEB The conference was held in Copper Mountain CO from July 11 16 1999 It was an extension of a New York Academy of Sciences meeting entitled Primordial Immunity Foundations for the Vertebrate Immune System held on May 2 5 1993 at the Marine Biological Laboratories in Woods Hole MA The proceedings of that meeting were published in The Annals of the New York Academy of Sciences volume 712 At that meeting all the attendees agreed that this type of conference a relatively small focused gathering allowed for participation by investigators at all levels of their careers We further agreed that we should search for a forum that would allow this meeting to continue The FASEB Summer Research Conference was an excellent vehicle for this type of meeting Furthermore this year's participants decided to continue this meeting as a regularly scheduled FASEB sponsored event This was a unique conference in the sense that it focused upon mechanisms of development and defense in protostome and deuterostome invertebrates and lower vertebrates There was a strong emphasis on evolutionary cell biology phylogenetic inferences and the evolution of recognition and regulatory systems

Handbook of Immune Response Genes Tak W. Mak, John J. L. Simard, 2007-07-27 The study of immunology encompasses a vast and ever growing body of information that in some way or other incorporates most areas of medical biological research As the body of information in the medical sciences continues to increase its rate of expansion one of the greatest challenges to investigators will be to integrate this information in a manner that is intellectually fruitful and

productive Considering the intended scope of this text we could not pretend to have gone too far toward achieving such an integration and considering the pace of change in its very best form a measured approximation of such lofty goals might be the most we could hope for Nevertheless in these pages we have sought to produce a collection of information that is at once concise and up to date regarding areas where important developments are impacting on the way we understand the vertebrate immune system In addition although the information is geared toward advanced study we have discussed some basic elements and concepts that we hope make the text a useful resource for both the immunologist and the nonspecialist The intention is to provide the researcher clinician or advanced undergraduate student with a brief overview of specific components of the immune system and to provide a place from which to begin further detailed study if necessary To this end we made every effort to supply extensive referencing although limitations in space prevented exhaustive or complete referencing in some cases

Neurobiology of Alzheimer's Disease David Dawbarn, Shelley J. Allen, 2007-05-03 Alzheimer's disease is the most common form of dementia in the elderly 450 000 people in the UK and 4 5 million people in the USA suffer with this disease This 3rd edition of Neurobiology of Alzheimer's Disease gives a comprehensive and readable introduction to the disease from molecular pathology to clinical practice The book is intended for readers new to the field and it also covers an extensive range of themes for those with in depth knowledge of Alzheimer's disease It will therefore act either as an introduction to the whole field of neurodegeneration or it will help experienced researchers to access the latest research in specialist topics Each chapter is written by eminent scientists leading their fields in neuropathology clinical practice and molecular neurobiology appendices detail disease associated proteins their sequences familial mutations and known structures It will be essential reading for students interested in neurodegeneration and for researchers and clinicians giving a coherent and cohesive approach to the whole area of research and allowing access at different levels For those in the pharmaceutical industry it describes the underlying molecular mechanisms involved in the pathogenesis of Alzheimer's disease and explains how current and potential therapeutics may work
