in Symbiosis Research: Integrative Approaches M. Pilar Francino, Mónica Medina, 2017-02-02 Traditionally symbiosis
research has been undertaken by researchers working independently of one another and often focused on a few cases of
bipartite host symbiont interactions New model systems are emerging that will enable us to fill fundamental gaps in
symbiosis research and theory focusing on a broad range of symbiotic interactions and including a variety of multicellular
hosts and their complex microbial communities In this Research Topic we invited researchers to contribute their work on
diverse symbiotic networks since there are a large variety of symbioses with major roles in the proper functioning of
terrestrial or aquatic ecosystems and we wished the Topic to provide a venue for communicating findings across diverse
taxonomic groups A synthesis of recent investigations in symbiosis can impact areas such as agriculture where a basic

understanding of plant microbe symbiosis will provide foundational information on the increasingly important issue of nitrogen fixation climate change where anthropogenic factors are threatening the survival of marine symbiotic ecosystems such as coral reefs animal and human health where unbalances in host microbiomes are being increasingly associated with a wide range of diseases and biotechnology where process optimization can be achieved through optimization of symbiotic partnerships Overall our vision was to produce a volume of works that will help define general principles of symbiosis within a new conceptual framework in the road to finally establish symbiology as an overdue central discipline of biological science
