USAF Formal Schools United States. Dept. of the Air Force,1987 AAHS Journal American Aviation Historical Society,1967 Civil Society in Zimbabwe Mandlenkosi Mpofu,Dion Nkomo,Kirk Helliker,2025-09-01 This book considers the historical and spatial dimensions of civil society in Zimbabwe s Matabeleland region an area suffering from severe development and democratic deficits over many decades Transcending an organisational conception of civil society and a simplistic state civil society dualist understanding it recognises the dynamic character of civil society as a social space inclusive of less formalised associational forms of collective life as well as the colonial character and legacies of civil society both analytically and empirically This book facilitates a nuanced understanding of the specificities of the social political and economic evolution of Matabeleland in colonial and post colonial Zimbabwe and the region s troubled relations with the central state Historically it traces civil society in Matabeleland from the region s resistance against the colonial settler state to contemporary struggles for justice given the unresolved Gukurahundi legacy Civil society is depicted as constituted by a

set of complex and shifting struggles for justice not simply between Matabeleland and the central state but also internally within Matabeleland along multiple fault lines including class and culture The relevance of understanding civil society in Matabeleland for Zimbabwe and Africa more widely is brought to the fore The book will be of interest and value to scholars of civil society politics and democratisation across the African continent

On-demand Link-state Routing in Ad-hoc Networks Soumya Roy, 2003 This thesis explores the challenges merits and demerits of using link state information for on demand routing in ad hoc networks such that routers maintain path information for only those destinations for which they have data traffic We first present the source tree on demand adaptive routing SOAR protocol in which each router exchanges with its neighbors a source tree containing paths to only those destinations for which the router is the source or relay of data packets The main advantage of SOAR is that it is more scalable and better performing than current state of the art on demand routing protocols However a limitation of SOAR is that it requires data packets to specify the paths they traverse to detect loops To eliminate the need for source routing or path traversal information in data packets we introduce the on demand link vector OLIVE protocol which prevents temporary loops for each destination by synchronizing relevant link state information among neighbors In OLIVE the advertised paths combine to form a source graph rather than a source tree OLIVE is shown to outperform the current routing protocols proposed for mobile ad hoc networks in terms of control overhead throughput and network delay
