

Pedigrees to Trace Inheritance Patterns

Introduction:

Pedigrees are diagrams that depict the relationships of individuals in a family. These diagrams can be used to discover the phenotypes and genotypes of other family members. They can also be used to predict the probability of the presence of a particular allele in unborn offspring based on the determination of parental genotypes. Pedigrees use a square to represent a male and a circle to represent a female. A shape that is filled in represents an individual who displays the phenotype of the allele being traced. A shape that is half-filled indicates that the individual is a "carrier", someone who carries the allele but does not display the affected phenotype. Horizontal lines emerging from the side of a shape indicate marriage. Vertical lines emerging from the top of a shape indicate sibling relationships. The numbers to the far right of the diagram indicate the generation.

Objectives:

- The learner will be able to recognize the inheritance patterns of recessive, dominant and sex-linked traits.
- The learner will be able to draw and interpret relationships using a pedigree.

Pedigree A – Recessive Allele Inheritance Patterns

The pedigree below shows the incidence of sickle cell trait (which is represented by phenotypes with a half-filled shape or genotype of Hh) and sickle cell disease (which is represented by phenotypes with a filled shape or genotype of hh). One out of every ten African-Americans is a carrier for the disease. All individuals in the pedigree with sickle cell disease have been labeled with their phenotypes. Some genotypes have been added to help you get started. Fill in the remaining phenotypes and genotypes.
