Hammer,1977 Biodeterioration of Concrete Thomas Dyer,2017-07-12 Awareness of the importance of ensuring durability of concrete has been a growing concern of engineers and there is now considerable understanding of the mechanisms which cause its deterioration and means of limiting such damage through the use of appropriate materials and approaches to design Many of the deterioration mechanisms which

affect concrete are the result of interaction with the non living environment chlorides in seawater carbon dioxide in the atmosphere cyclic freezing and thawing However living organisms can also cause damage through both chemical and physical processes which under the right conditions can be severe This book looks at all forms of concrete biodeterioration together for the first time It examines from a fundamental starting point biodeterioration mechanisms as well as the conditions which allow living organisms bacteria fungi plants and a range of marine organisms to colonise concrete A detailed evaluation of chemical compounds produced by living organisms with respect to their interaction with the mineral constituents of concrete and the implications it has for the integrity of structures is also included Approaches to avoiding biodeterioration of concrete are also covered including selection of materials mix proportioning design and use of protective systems
