Introduction

1.1. Setting the stage

1.1.1. Background of research: Trends influencing industrial product development

The knowledge platform of this promotion research is industrial product development, which has been strongly influenced by four major trends in the last decades. These trends are: (i) diversification of human and social needs, (ii) rapid development and uncontrolled proliferation of advanced technologies, (iii) evolution of product manifestations and implementations, and (iv) sophistication of design approaches and methodologies. Together, these trends have led to a shift in the approaches for realizing the products. The first trend, diversification of human and social needs, is associated with striving after better well-being. As a result of this trend, there is an intensification of consumer-oriented economy, as well as a continuous change in humans' needs. The different kinds of human needs and their relationship have been described by Maslow's model of hierarchy of needs [1]. Represented as a pyramid, this model includes five hierarchically arranged levels that build upon each other [2]. At the bottom of the hierarchy are the physiological needs, which are complemented by the safety, social, and esteem needs. The top-level expresses the self-actualization needs. To fulfill the higher level needs, large percentage of lower level needs should be fulfilled [3]. Designers usually face complex design tasks when they pursue the fulfillment of the higher levels of needs, in particular, when this challenge needs to be handled in constantly changing situations. For these reasons, designing products for the satisfaction of the higher-level needs entails new ways of thinking, novel strategies, and innovative concepts [4].

The second trend, 'rapid development and uncontrolled proliferation of advanced technologies', can be observed in many forms, for instance, it is reflected by the rapid developments in the electronics industry. Electrification started some 150 years ago. Some 90 years ago, complex electronic controller solutions were developed in the military industry. Seventy years ago, the concept of digital computing was introduced and rapidly proliferated in the industry. From the 1960s the emerging computer technologies have been complemented by advanced software and information processing technologies, advanced material technologies, and energy provisioning technologies. As a result of

Design of Wastewater and Stormwater Pumping Stations, 1981

Water & Wastewater Engineering M. S. Karuna, 2023-12-27 The purification of wastewater is of the utmost importance for environmental preservation and animal and human health Improper treatment of effluent can result in the contamination of water sources the destruction of natural habitats and the transmission of severe diseases Wastewater

treatment plants perform precisely as their name implies they treat the water that is discharged back into the environment after treating it at the source Further action is necessary notwithstanding the global installations of these plants that are currently underway Water is a critically valuable resource that is currently being wasted There are numerous methods for treating effluent the greater the efficiency of the treatment process the greater the proportion that can be recycled prior to its discharge into the ocean The principal objective of wastewater treatment technologies is to safeguard both human health and local ecosystems against the presence of hazardous substances in wastewater Due to the fact that the natural process of water purification cannot maintain pace with the amount of refuse produced by society water treatment facilities were created to accelerate the process In developing nations that have yet to implement established wastewater treatment systems the absence of these processes would significantly increase the dangers of daily life and prevent the recycling of wastewater
