

Struts 2 - Quick Guide

Basic MVC Architecture

Model View Controller or **MVC** as it is popularly called, is a software design pattern for developing web applications. A Model View Controller pattern is made up of the following three parts -

- **Model** - The lowest level of the pattern which is responsible for maintaining data.
- **View** - This is responsible for displaying all or a portion of the data to the user.
- **Controller** - Software Code that controls the interactions between the Model and View.

MVC is popular as it isolates the application logic from the user interface layer and supports separation of concerns. Here the Controller receives all requests for the application and then works with the Model to prepare any data needed by the View. The View then uses the data prepared by the Controller to generate a final presentable response. The MVC abstraction can be graphically represented as follows.

J2EE FrontEnd Technologies Lennart Jorelid, 2001-12-01. Servlets and JSP/Java Server Pages are the main way that Java is used in the Web today. These are Java programs that run on a Web server that allow HTML content to be dynamically generated, often by querying a database and then sent via the web to a client machine that made the request in the first place. Jorelid's book concentrates on teaching the program architect and designer how to fit the various pieces together, spending as little time as possible on the mechanics of coding. As the tech reviewer puts it, Jorelid's perspective is unique and not voiced in any of the popular Servlet books such as the ones by Jason Hunter, Marty Hall, Calloway, etc. The code examples in the touring the package sections nicely explain how to use the important methods in the Servlet API. I have yet to see any existing books get into these useful details.
