

16 Darwin's Theory of Evolution

Evolution

Q: What is natural selection?

18.1 What patterns of biodiversity did Darwin observe around the world?

WHAT I KNOW

Learn's answer: On each island that Darwin visited, he saw different species of plants and animals.

WHAT I LEARNED

Learn's answer: Darwin noticed that different, yet similar, species inhabited separate, but similar, habitats around the globe. Also, different, yet related, species often occupied different habitats within a local area.

18.2 How did other scientists' work help Darwin develop his theory of natural selection?

Learn's answer: Other scientists did research on how organisms behaved differently.

Learn's answer: Hutton and Lyell concluded that Earth is extremely old. Lamarck suggested that species can not float. Malthus reasoned larger populations would deplete resources.

18.3 What is Darwin's theory of evolution by natural selection?

Learn's answer: Organisms that are best adapted to their environment survive longer and have more offspring.

Learn's answer: Natural selection is the process by which organisms with variations most suited to their local environment survive and have more offspring. Over time, beneficial traits accumulate in a population.

18.4 What are the main lines of scientific evidence that support Darwin's theory of evolution by natural selection?

Learn's answer: Fossils show how organisms have changed over time.

Learn's answer: Biogeography, fossils, homologous structures, vestigial structures, embryological development, the universal genetic code, analogous molecules, and field studies provide evidence of evolution.
