Modeling Life Alan Garfinkel,Jane Shevtsov,Yina Guo,2017-09-06 This book develops the mathematical tools essential for students in the life sciences to describe interacting systems and predict their behavior From predator prey populations in an ecosystem to hormone regulation within the body the natural world abounds in dynamical systems that affect us profoundly Complex feedback relations and counter intuitive responses are common in nature this book develops the quantitative skills needed to explore these interactions Differential equations are the natural mathematical tool for quantifying change and are the driving force throughout this book The use of Euler s method makes nonlinear examples tractable and accessible to a broad spectrum of early stage undergraduates thus providing a practical alternative to the procedural approach of a traditional Calculus curriculum Tools are developed within numerous relevant examples with an emphasis on the construction evaluation and interpretation of mathematical models throughout Encountering these concepts in context students learn not only quantitative techniques but how to bridge between biological and mathematical ways of thinking Examples range broadly exploring the dynamics of neurons and the immune system through to population dynamics and the Google PageRank algorithm Each scenario relies only on an interest in the natural world no biological expertise is assumed of student or instructor Building on a single prerequisite of Precalculus the book suits a two quarter sequence for first or second year undergraduates and meets the mathematical requirements of medical school entry The later material provides opportunities for more advanced students in both mathematics and life sciences to revisit theoretical knowledge in a rich real world framework In all cases the focus is clear how does the math help us understand the science *Algebra in the Early Grades* James J. Perspectives on the Teaching of Geometry for the 21st Century C. Mammana, V. Villani, 2012-12-06 In recent years geometry seems to have lost large parts of its former central position in mathematics teaching in most countries However new trends have begun to counteract this tendency There is an increasing awareness that geometry plays a key role in mathematics and learning mathematics Although geometry has been eclipsed in the mathematics curriculum research in geometry has blossomed as new ideas have arisen from inside mathematics and other disciplines including computer science Due to reassessment of the role of geometry mathematics educators and mathematicians face new challenges In the present ICMI study the whole spectrum of teaching and learning of geometry is analysed Experts from all over the world took part in this study which was conducted on the basis of recent international research case studies and reports on actual school practice This book will be of particular interest to mathematics educators and mathematicians who are involved in the teaching of geometry at all educational levels as well as to researchers in mathematics education
