Moving Objects Management Xiaofeng Meng, Jidong Chen, 2011-01-27. We live in an age of rapid technological development. The Internet already affects our lives in many ways. Indeed, we continue to depend more and more intrinsically on the Internet, which is increasingly becoming a fundamental piece of societal infrastructure, just as water supply, electricity grids and transportation networks have been for a long time. But while these other infrastructures are relatively static, the Internet is undergoing swift and fundamental change. Notably, the Internet is going mobile. The world has some 6.7 billion humans, 4 billion mobile phones and 1.7 billion Internet users. The two most populous continents, Asia and Africa, have relatively low Internet penetration and hold the greatest potentials for growth. Their mobile phone users by far outnumber their Internet users, and the numbers are growing rapidly. China and India are each gaining about half a dozen million new phone users per month. Users across the globe as a whole increasingly embrace mobile Internet devices, with smart phone sales starting to outnumber PC sales. Indeed, these and other facts suggest that the Internet stands to gain a substantial mobile component. This mega trend towards mobile is enabled by rapid and continuing advances in key technology areas such as mobile communication.

P. Fourman, P. T. Johnstone, A. M. Pitts, 1992-06-26 Category theory and related topics of mathematics have been increasingly applied to computer science in recent years This book contains selected papers from the London Mathematical Society Symposium on the subject which was held at the University of Durham Participants at the conference were leading computer scientists and mathematicians working in the area and this volume reflects the excitement and importance of the meeting All the papers have been refereed and represent some of the most important and current ideas Hence this book will be essential to mathematicians and computer scientists working in the applications of category theory **Network Algebra** Gheorghe Stefanescu, 2012-12-06 Network Algebra considers the algebraic study of networks and their behaviour It contains general results on the algebraic theory of networks recent results on the algebraic theory of models for parallel programs as well as results on the algebraic theory of classical control structures The results are presented in a unified framework of the calculus of flownomials leading to a sound understanding of the algebraic fundamentals of the network theory The term network is

used in a broad sense within this book as consisting of a collection of interconnecting cells and two radically different specific interpretations of this notion of networks are studied One interpretation is additive when only one cell is active at a given time this covers the classical models of control specified by finite automata or flowchart schemes The second interpretation is multiplicative where each cell is always active covering models for parallel computation such as Petri nets or dataflow networks More advanced settings mixing the two interpretations are included as well Network Algebra will be of interest to anyone interested in network theory or its applications and provides them with the results needed to put their work on a firm basis Graduate students will also find the material within this book useful for their studies

Parallel Algorithm Derivation and Program Transformation Robert Paige, J.H. Reif, Ralph Wachter, 2007-08-28 This book contains selected papers from the ONR Workshop on Parallel Algorithm Design and Program Transformation that took place at New York University Courant Institute from Aug 30 to Sept 1 1991 The aim of the workshop was to bring together computer scientists in transformational programming and parallel algorithm design in order to encourage a sharing of ideas that might benefit both communities It was hoped that exposure to algorithm design methods developed within the algorithm community would stimulate progress in software development for parallel architectures within the transformational community It was also hoped that exposure to syntax directed methods and pragmatic programming concerns developed within the transformational community would encourage more realistic theoretical models of parallel architectures and more systematic and algebraic approaches to parallel algorithm design within the algorithm community The workshop Organizers were Robert Paige John Reif and Ralph Wachter The workshop was sponsored by the Office of Naval Research under grant number N00014 90 J 1421 There were 44 attendees 28 presentations and 5 system demonstrations All attendees were invited to submit a paper for publication in the book Each submitted paper was refereed by participants from the Workshop The final decision on publication was made by the editors There were several motivations for holding the workshop and for publishing papers contributed by its participants Transformational programming and parallel computation are two emerging fields that may ultimately depend on each other for success
