Fig. 9.23

Conversely, if a light source is located at the focus of a parabolic reflector, then the reflected rays will form a beam of parallel rays parallel to the axis of parabola as shown in the figure 9.23. The parabolic reflectors in automobile headlights and flash light use this rule. The optical principles which have been discussed above are also valid for radar signals, sound waves, radio waves etc.

Parabolas are also used in suspension problems related to suspension bridges and structures.

Fig. 9.24

We know that the cables of suspension bridges are mostly parabolic in shape. This shape provides the stability of bridges. The weight of the bridge and other physical forces (tensions, compressions) acting on the cable are transferred by the parabolic cables to the towers to which the cables are attached. This transfer of physical forces helps the bridges to remain operational for a long period of time.

Let us solve few examples related to suspension and reflection.

Example 1. How far from vertex should a light source be placed on the axis of parabolic reflector so that it produces a beam of parallel rays, whereas the depth and length of chord perpendicular on axis of parabolic reflector are 10 cm and 12 cm respectively and the parabola is cup-right.

Solution: Let the vertex of parabolic reflector is at origin as shown in the figure 9.25.
