

Surface Weather Map Showing Storm System in the Eastern United States

Figure 2: Simplified surface weather map showing a storm system in the eastern US.

Warm air advection occurs where the wind flows across isobars from higher pressure to lower (warmer) values. Thus, warm air is being transported across a certain location by the horizontal winds. Based on this fact alone, one would expect precipitation at that location to be rising, cold air advection occurs where the wind flows across the isobars from lower (colder) values to higher (warmer) values. Thus, colder air being transported by the wind to a certain location produces falling temperatures.

Based on wind directions and the isobars pattern on the Figure 2 map, determine the type of air advection (warm or cold) that would be occurring at each station.

3. Winds at station two are occurring at Station _____.

- ☐ A
- ☐ B
- ☐ C
- ☐ D

4. Could air advection occur occurring at Station _____.

- ☐ B
- ☐ C
- ☐ D

5. Considering the fact that direction of wind and temperature pressure associated with weather systems, station of Low can be expected to have _____ air advection.

- ☐ warm
- ☐ cold

6. Meanwhile, station to the west and southwest of Low can be expected to have _____ air advection.

- ☐ warm
- ☐ cold

7. Areas to the east of High would be expected to have _____ air advection.

- ☐ warm
- ☐ cold

8. And while you choose from that only; weather based factor would be a High area to the west of High would have _____ air advection.

- ☐ warm
- ☐ cold
