Integrative Document & Content Management Len Asprey, Michael Middleton, 2003-01-01 Portals present unique strategic challenges in the academic environment Their conceptualization and design requires the input of campus constituents who seldom interact and whose interests are often opposite The implementation of a portal requires a coordination of applications and databases controlled by different campus units at a level that may never before have been attempted at the institution Building a portal is as much about constructing intra campus bridges as it is about user interfaces and content Designing Portals Opportunities and Challenges discusses the current status of portals in higher education by providing insight into the role portals play in an institution s business and educational strategy by taking the reader through the processes of conceptualization design and implementation of the portals in different stages of development at major universities and by offering insight from three producers of portal software systems in use at institutions of higher learning and elsewhere

Application Level Security Management Michael Neuhaus, 2005-04-25
Inhaltsangabe Abstract Today more and more enterprises are developing business applications for Internet usage which results in the exposure of their sensitive data not only to customers and business partners but also to hackers Because web applications provide the interface between users sitting somewhere within the World Wide Web and enterprises backend

resources hackers can execute sophisticated attacks that are almost untraceable aiming to steal modify or delete enterprises vital data even when it is protected by passwords or encryption As recent viruses and worms such as Nimda CodeRed or MSBlast have shown modern attacks are occurring at the application itself since this is where high value information is most vulnerable Such attack scenarios are becoming very problematic nowadays since traditional network security products such as firewalls or network intrusion detection systems are completely blind to those malicious activities and therefore can not offer any protection at all Modern protection mechanisms require more sophisticated detection capabilities in order to protect enterprises assets from such attacks now and in the future Additionally web application security currently is a highly dynamic and also very emerging field within enterprises IT security activities Therefore this diploma thesis aims to provide a strong focussed picture on the current state of web application security and its different possibilities to raise the overall security level of already implemented web applications and also of future web applications Acting as a basis for further analysis the currently most common web application vulnerabilities are described to get an overview of what a web application has to be protected of and where the root problems of these weaknesses are lying Although these generic categories may not be applicable to every actually implemented web application they may be used as baseline for future web applications Armed with the background of the current vulnerabilities and their related root causes a detailed analysis of currently available countermeasures will provide recommendations that may be taken at each of the certain stages of a web application s lifecycle Since all further decisions generally should be based upon risk evaluations of specifically considered systems a possible risk management assessment methodology is provided within the thesis Controls and countermeasures are provided from an
