Extending the Reach of Statistical Software Testing Robert John Weber, 2004 Statistical software testing is a promising technique for reducing the software testing burden by applying test cases to the software under test according to a model of the expected usage of the system in operation called an operational profile However current statistical testing techniques have not been put into general practice as they do not scale well as the complexity of the systems under test increases In particular as system complexity increases the matrices required to generate test cases and perform model analysis can grow dramatically even exponentially overwhelming the test generation and analysis applications In this work a new technique for representing the operational profile is proposed to mitigate the complexity issue for statistical test case generation The use of a state based requirements specification model as the basis of the operational profile leverages parallelism to reduce the visible size of the model The specification model can then be extended to include conditional probabilities of input data occurrence This work also proposes a statistical testing framework using this specification based operational profile to generate and execute test cases Such a framework allows us to evaluate the effectiveness and efficiency of this statistical testing technique *Isotopic Constraints on Earth System Processes* Kenneth W.
