Modern Multidimensional Scaling I. Borg, P. J. F. Groenen, 2007-04-27 Multidimensional scaling MDS is a technique for the analysis of similarity or dissimilarity data on a set of objects Such data may be intercorrelations of test items ratings of similarity on political candidates or trade indices for a set of countries

MDS attempts to model such data as distances among points in a geometric space The main reason for doing this is that one wants a graphical display of the structure of the data one that is much easier to understand than an array of numbers and moreover one that displays the essential information in the data smoothing out noise There are numerous varieties of MDS Some facets for distinguishing among them are the particular type of geometry into which one wants to map the data the mapping function the algorithm used to find an optimal data representation the treatment of statistical error in the models or the possibility to represent not just one but several similarity matrices at the same time Other facets relate to the different purposes for which MDS has been used to various ways of looking at or interpreting an MDS representation or to differences in the data required for the particular models In this book we give a fairly comprehensive presentation of MDS For the reader with applied interests

only the first six chapters of Part I should be sufficient. They explain the basic notions of ordinary MDS with an emphasis on how MDS can be helpful in answering substantive questions.

Flexible Pipes Qiang Bai, Yong Bai, Weidong Ruan, 2017-04-19

Nonlinear Finite Element Analysis in Structural Mechanics W. Wunderlich, E. Stein, K.J. Bathe, 2013-03-14
 With the rapid development of computational capabilities nonlinear finite element analysis in structural mechanics has become an important field of research. Its objective is the realistic assessment of the actual behavior of structures by numerical methods. This requires that all nonlinear effects such as the nonlinear characteristics of the material and large deformations be taken into account. The activities in this field being worldwide direct interaction between the various research groups is necessary to coordinate future research and to overcome the time gap between the generation of new results and their appearance in the literature. The first U.S.-Germany Symposium was held in 1976 at the Massachusetts Institute of Technology. Under the general topic of Plastic Formulations and Computational Algorithms in Finite Element Analysis it provided an opportunity for about 20 researchers from each country to present lectures hold discussions and establish mutual contacts. The success of this first symposium was so encouraging that it seemed natural to organize a second bilateral meeting this time in Germany and to invite researchers from other European countries as well.
