Overcurrent Protection NEC Article 240 and Beyond Gregory P. Bierals, 2021-12-22 An overcurrent is caused by a short circuit ground fault or an overload A short circuit may be hundreds or even thousands of times above the normal operating current This type of fault may be an arcing fault between ungrounded conductors or between an ungrounded conductor and a grounded usually a neutral conductor a line to line arcing fault may produce a current of 74% of a 3 phase bolted fault A line to neutral arcing fault will be somewhat less A line to line bolted fault the equivalent of the conductors bolted together may be up to 100% of the available short circuit current A line to neutral bolted fault may be in excess of 100% of the 3 phase bolted fault at the source but considerably less downstream A ground fault that is the equivalent of a connection between an ungrounded conductor and the equipment grounding system will produce a current that may be 38% or higher of the 3 phase bolted fault current These types of faults are typically arcing faults which normally are intermittent in nature That is they strike and restrike over time and may produce a short circuit

fault due to insulation damage Once again a line to equipment ground fault near the source may produce a fault current of over 100% of the 3 phase bolted fault but considerably less downstream An overload typically ranges from one to six times the normal current and are normally caused by motor starting currents or transformer magnetizing currents These conditions are of such short duration that the circuit components are not damaged This book has a detailed analysis of these types of faults along with explanations and examples of the various types of overcurrent protective devices to assure proper protection This volume has extensive information on the application of overcurrent protection for conductors and equipment The reader will be able to calculate fault currents as well as establishing the short circuit withstand rating of conductor insulation and to determine the appropriate type of overcurrent devices based on circuit conditions In addition determining ground fault currents for the purpose of selecting the proper size of equipment grounding conductors to establish an effective ground fault current path is discussed in detail Readership Anyone involved with the design of overcurrent protection for electrical distribution systems from the system source to the electrical utilization equipment The emphasis is placed on the design of the overcurrent protection for specific installations to assure proper protection for the circuit components regardless of the type of fault encountered *Commercial Electrical Wiring* John E. Traister, 2000 Commercial work uses more material and the work is usually smooth long lasting and more profitable than residential This updated book has the explanations examples and tips to help you comply with the parts of the NEC that apply to commercial wiring in load calculations sizing of electrical services selecting and installing overcurrent protection and more You ll also find how to read and understand symbols plans drawings and schematics common in commercial electrical work If you want to increase your work volume and profits by moving into commercial electrical work get this book [Illustrated Guide to the National Electrical Code, 1993](#) John E.
