Precision Metal Additive Manufacturing Richard Leach, Simone Carmignato, 2020-09-21 Additive manufacturing AM is a fast growing sector with the ability to evoke a revolution in manufacturing due to its almost unlimited design freedom and its capability to produce personalised parts locally and with efficient material use AM companies however still face technological challenges such as limited precision due to shrinkage built in stresses and limited process stability and robustness Moreover often post processing is needed due to high roughness and remaining porosity Qualified trained personnel are also in short supply In recent years there have been dramatic improvements in AM design methods process control post processing material properties and material range However if AM is going to gain a significant market share it must be developed into a true precision manufacturing method The production of precision parts relies on three principles Production is robust i.e. all sensitive parameters can be controlled Production is predictable for example the shrinkage that occurs is acceptable because it can be predicted and compensated in the design Parts are measurable as without metrology accuracy repeatability and quality assurance cannot be known AM of metals is inherently a high energy process with many sensitive and inter related process parameters making it susceptible to thermal distortions defects and process drift The complete modelling of these processes is beyond current computational power and novel methods are needed to practicably predict performance and inform design In addition metal AM produces highly textured surfaces and complex surface features that stretch the limits of contemporary metrology With so many factors to consider there is a significant shortage of background material on how to inject precision into AM processes Shortage in such material is an important barrier for a wider uptake of advanced manufacturing technologies and a comprehensive book is thus needed This book aims to inform the reader how to improve the precision of metal AM processes by tackling the three principles of robustness predictability and metrology and by developing computer aided engineering methods that empower rather than limit AM design Richard Leach is a professor in metrology at the University of Nottingham and heads up the Manufacturing Metrology Team Prior to this position he was at the National Physical Laboratory from 1990 to 2014 His primary love is instrument building from concept to final installation and his current interests are the dimensional measurement of precision and additive manufactured structures His research themes include the measurement of surface topography the development of methods for measuring 3D structures the development of methods for controlling large surfaces to high resolution in industrial applications and the traceability of X ray computed tomography He is a leader of several professional societies and a visiting professor at Loughborough University and the Harbin Institute of Technology Simone Carmignato is a professor in manufacturing engineering at the

University of Padua His main research activities are in the areas of precision manufacturing dimensional metrology and industrial computed tomography He is the author of books and hundreds of scientific papers and he is an active member of leading technical and scientific societies He has been chairman organiser and keynote speaker for several international conferences and received national and international awards including the Taylor Medal from CIRP the International Academy for Production Engineering

Mechanical design for electronics product Jerry Wang, 2019-10-22 This is a summary of my over 15 years work as a mechanical design engineer in electronics industry The contents include The task design considerations developing steps of mechanical design for electronics product The frequent using mechanical components design guideline Specific function design such as seal EMC screw torque definition and calculation Tolerance analysis Preliminary thermal distribution design Other topics such as DFM failure root cause analysis etc Components design guideline is the major part of this book The components are categorized according manufacturing method such as sheet metal plastic injection die casting Aluminium extrusion over mold rubber keypad and standards components selection In each individual guideline the typical structure is used to include the main items of Characters about advantages and disadvantages Brief description of typical manufacturing process and related equipment Frequent using material Structure design considerations Typical features Tolerance Frequent defects and analysis The aim of this book is to provide guide and support to the junior mechanical design engineers in electronics industry and I assume the readers have mechanical knowledge and reasonable design practise So I excluded the massive basics that can be found from popular manuals or standards to make the book brief and wish could bring the readers practical help

Plastic Conversion Processes Eric Cybulski, 2009-05-28 The explosion of plastic material development continues to generate a proliferation of conversion processes and variants of these methods Unfortunately most books on plastics conversion focus on a single process such as injection molding limiting their usefulness to readers without prior knowledge of the field Few if any single source texts
