Relativistic Astrophysics, 2 I[A]kov Borisovich Zel'dovich, I. D. Novikov, 1971 Though the kinematics of the evolving universe became known decades ago research into the physics of processes occurring in the expanding universe received a reliable observational and theoretical basis only in more recent years These achievements have led in turn to the emergence of new problems on which an unusually active assault has begun This second volume of Relativistic Astrophysics provides a remarkably complete picture of the present state of cosmology It is a synthesis of the theoretical foundations of contemporary cosmology which are derived from work in relativity plasma theory thermodynamics hydrodynamics and particle physics It presents the theoretical work that explains describes and predicts the nature of the universe the physical process that occur in it the formation of galaxies the synthesis of the light elements and the cosmological singularity and the theory of gravitation This book long and eagerly awaited is essential for everyone whose work is related to cosmology and astrophysics
