*Linear Matrix Inequalities in System and Control Theory* Stephen Boyd, Laurent El Ghaoui, Eric Feron, Venkataramanan Balakrishnan, 1994-01-01 In this book the authors reduce a wide variety of problems arising in system and control theory to a handful of convex and quasiconvex optimization problems that involve linear matrix inequalities These optimization problems can be solved using recently developed numerical algorithms that not only are polynomial time but also work very well in practice the reduction therefore can be considered a solution to the original problems This book opens up an important new research area in which convex optimization is combined with system and control theory resulting in the solution of a large number of previously unsolved problems

Distributed Optimization and Statistical Learning Via the Alternating Direction Method of Multipliers Stephen Boyd, Neal Parikh, Eric Chu, Borja Peleato, Jonathan Eckstein, 2011 Surveys the theory and history of the alternating direction method of multipliers and discusses its applications to a wide variety of statistical and machine learning problems of recent interest including the lasso sparse logistic regression basis pursuit covariance selection support vector machines and many others
