Thermal System Design and Optimization C. Balaji, 2021-01-29 This highly informative and carefully presented textbook introduces the general principles involved in system design and optimization as applicable to thermal systems followed by the methods to accomplish them. It introduces contemporary techniques like Genetic Algorithms, Simulated Annealing, and Bayesian Inference in the context of optimization of thermal systems. There is a separate chapter devoted to inverse problems in thermal systems. It also contains sections on Integer Programming and Multi Objective optimization. The linear programming chapter is fortified by a detailed presentation of the Simplex method. A major highlight of the textbook is the inclusion of workable MATLAB codes for examples of key algorithms discussed in the book. Examples in each chapter clarify the concepts and methods presented and end of chapter problems supplement the material presented and enhance the learning process.

Convexification and Global Optimization in Continuous and Mixed-Integer Nonlinear Programming Mohit Tawarmalani,Nikolaos V. Sahinidis,2013-04-17 Interest in constrained optimization originated with the simple linear programming model since it was practical and perhaps the only computationally tractable model at the time Constrained linear optimization models were soon adopted in numerous application areas and are perhaps the most widely used mathematical models in operations research and management science at the time of this writing Modelers have however found the assumption of linearity to be overly restrictive in expressing the real world phenomena and problems in economics finance business communication engineering design computational biology and other areas that frequently demand the use of nonlinear expressions and discrete variables in optimization models Both of these extensions of the linear programming model are NP hard thus representing very challenging problems On the brighter side recent advances in algorithmic and computing technology make it possible to revisit these problems with the hope of solving practically relevant problems in reasonable amounts of computational time Initial attempts at solving nonlinear programs concentrated on the development of local optimization methods guaranteeing globality under the assumption of convexity On the other hand the integer programming literature has concentrated on the development of methods that ensure global optima The aim of this book is to marry the advancements in solving nonlinear

and integer programming models and to develop new results in the more general framework of mixed integer nonlinear programs MINLPs with the goal of devising practically efficient global optimization algorithms for MINLPs
