Ghosh,Shigeyoshi Tsutsui,2012-12-06 The term evolutionary computing refers to the study of the foundations and applications of certain heuristic techniques based on the principles of natural evolution thus the aim of designing evolutionary algorithms EAs is to mimic some of the processes taking place in natural evolution These algorithms are

classified into three main categories depending more on historical development than on major functional techniques. In fact, their biological basis is essentially the same. Hence EC, GA, uGP, uES, uEP, EC. Evolutionary Computing, GA Genetic Algorithms, GP Genetic Programming, ES Evolution Strategies, EP Evolutionary Programming. Although the details of biological evolution are not completely understood even nowadays, there is some strong experimental evidence to support the following points: Evolution is a process operating on chromosomes rather than on organisms. Natural selection is the mechanism that selects organisms which are well adapted to the environment to reproduce more often than those which are not. The evolutionary process takes place during the reproduction stage that includes mutation which causes the chromosomes of offspring to be different from those of the parents and recombination which combines the chromosomes of the parents to produce the offspring. Based upon these features, the previously mentioned three models of evolutionary computing were independently and almost simultaneously developed. An evolutionary algorithm EA is an iterative and stochastic process that operates on a set of individuals called a population.

Statistics for Chemical and Process Engineers Yuri A.W. Shardt, 2015-10-16. A coherent, concise and comprehensive course in the statistics needed for a modern career in chemical engineering covers all of the concepts required for the American Fundamentals of Engineering examination. This book shows the reader how to develop and test models, design experiments and analyse data in ways easily applicable through readily available software tools like MS Excel and MATLAB. Generalized methods that can be applied irrespective of the tool at hand are a key feature of the text. The reader is given a detailed framework for statistical procedures covering data visualization, probability, linear and nonlinear regression, experimental design including factorial and fractional factorial designs and dynamic process identification. Main concepts are illustrated with chemical and process engineering relevant examples that can also serve as the bases for checking any subsequent real implementations. Questions are provided with solutions available for instructors to confirm the correct use of numerical techniques and templates for use in MS Excel and MATLAB can also be downloaded from extras.springer.com. With its integrative approach to system identification, regression and statistical theory, *Statistics for Chemical and Process Engineers* provides an excellent means of revision and self study for chemical and process engineers working in experimental analysis and design in petrochemicals, ceramics, oil and gas, automotive and similar industries and invaluable instruction to advanced undergraduate and graduate students looking to begin a career in the process industries.
