QUESTION A 60-year-old male with a 20-year history of type 2 diabetes mellitus presents with a 2-week history of increasing fatigue, weight loss, and decreased appetite. He reports that he has been unable to eat as much as he used to and has lost about 10 pounds. He also mentions that he has been feeling more tired than usual and has noticed some changes in his vision. He has no recent travel history and no known contact with anyone who has been ill. He is currently taking metformin and insulin. His last medical check-up was 6 months ago, where his blood sugar was well-controlled. He is a retired construction worker and lives with his wife. He has no other medical conditions and no family history of diabetes or related disorders.

ANSWER The patient's symptoms of fatigue, weight loss, and decreased appetite, along with his long history of type 2 diabetes, suggest a possible complication of his condition. Given the chronic nature of his diabetes and the recent onset of these symptoms, the most likely diagnosis is diabetic ketoacidosis (DKA). DKA is a serious complication of diabetes that occurs when the body produces too much ketones, which can lead to dehydration and electrolyte imbalances. The patient's weight loss and decreased appetite are also consistent with the metabolic changes occurring in DKA. The fact that his blood sugar was well-controlled 6 months ago suggests that his diabetes management may have become less effective recently, possibly due to a change in his insulin regimen or other factors. The patient's symptoms are not typical of a viral infection, and there is no evidence of recent travel or contact with someone who has been ill, making an infectious cause less likely. The patient's symptoms are also not consistent with a primary endocrine disorder like hypothyroidism, which would typically present with different symptoms such as cold intolerance and constipation. Therefore, the most appropriate next step is to evaluate the patient for DKA, which can be done through blood tests for glucose, ketones, and electrolytes, as well as a physical examination to assess for dehydration and other signs of metabolic acidosis.
