Protocells and the

Origin of Life Roberto Serra,Marco Villani,2025-08-28 How life can emerge in a lifeless environment is one of the major open scientific challenges This book pays particular attention to self organization phenomena that might have led to the appearance of the first protocells i e cell like structures much simpler than present day cells endowed with some primitive kinds of metabolism and heredity After a brief description of the known facts and main hypotheses mathematical and computational models of protocells are discussed they should complement laboratory experiments allowing rapid explorations of the dynamical properties of several alternative types of protocell architectures Given the great uncertainties about the actual origin of life it seems impossible to provide a detailed and complete reconstruction of the first life forms It is therefore necessary to identify plausible pathways highlighting the main physical and chemical processes towards life that can take place Generic models which are abstract enough to encompass different specific hypotheses are particularly relevant as they allow one to identify properties which are common to several different detailed scenarios They are widely discussed and a particular case is described in detail namely that of synchronization between the rate of molecular replication and that of reproduction of the whole protocell which is a necessary condition for sustainable growth of a

population and a prerequisite for further evolution Using generic models it is shown that such synchronization spontaneously emerges in successive generations under very general assumptions The book also contains extensive descriptions of the emergence of long polymers of autocatalytic sets and of the interactions between protocells and their environments The book is not meant only for specialists but also for scientists working in different fields as well as for laymen with an interest in science It requires a basic knowledge of chemistry and biology and an interest in simulation models **Logos of**

Value Practices in the Life Sciences and Medicine Isabelle Dussauge, Claes-Fredrik Helgesson, Francis Lee, 2015-01-29 Many deep concerns in the life sciences and medicine have to do with the enactment ordering and displacement of a broad range of values This volume articulates a pragmatist stance for the study of the making of values in society exploring various sites within life sciences and medicine and asking how values are at play This means taking seriously the work scientists regulators analysts professionals and publics regularly do in order to define what counts as proper conduct in science and health care what is economically valuable and what is known and worth knowing A number of analytical and methodological means to investigate these concerns are presented The editors introduce a way to indicate an empirically oriented research program into the enacting ordering and displacing of values They argue that a research programme of this kind makes it possible to move orthogonally to the question of what values are and thus ask how they are constituted This rectifies some central problems that arise with approaches that depend on stabilized understandings of value At the heart of it such a research programme encourages the examination of how and with what means certain things come to count as valuable and desirable how registers of value are ordered as well as displaced It further encourages a sense that these matters could be and sometimes simultaneously are otherwise
