Hormones and Reality John S. Torday, 2022-04-08 Cellular molecular approach to evolution has led to radical changes in our understanding of biologic principles ranging from the Cell to the Life Cycle Development Homeostasis Senescence Aging Heterochrony Pleiotropy Phenotype and perhaps the purpose of life itself Much of this new way of thinking about biology and medicine emanates from experimental evidence for epigenetic inheritance This leads one to question whether our unicellular state is the actual primary level of selection One particular system that is now recognized as being under the auspices of epigenetic inheritance is the endocrine system which is conventionally thought to regulate physiologic homeostasis However because the sex hormones play such a major role in behaviors related to the acquisition of epigenetic data and the processing of such epigenetic data by the gonads during meiosis their role in the evolution of the organism become tractable The composite of the activities of the individual over the course of its lifetime can now be understood causally resulting from the orchestration of its physiology by hormones prenatally postnatally and during the aging process across the entire life span of the organism Specific behaviors over the course of the life cycle during childhood adolescence puberty adulthood and aging can now be understood mechanistically rather than merely as milestones in the various stages of life With the above considerations in mind this book presents the cellular evolutionary perspective towards the relationship of the organism with its surroundings human and non human alike renders biology and medicine a continuum instead of fragmented unrelated anecdotes
