Many and ever more mobile users wish to enjoy a variety of multimedia services in very diverse geographical environments The growing number of communication options within and across wireless standards is accommodating the growing volume and heterogeneity in wireless wishes On the other hand advancement in radio technologies opening much more flexibility a o through Software Defined Radios opens up the possibility to realize mobile devices featuring multi mode options at low cost and interesting form factors It is crucial to manage the new degrees of freedom opened up in radios and standards in a smart way such that the required service is offered at satisfactory quality as efficiently as possible Efficiency in energy consumption is clearly primordial for battery powered mobile terminals specifically and in the context of growing ecological concerns in a broader context Moreover efficient usage of the spectrum is a growing prerequisite for wireless systems and coexistence of different standards puts overall throughput at risk The management of flexibility risks bringing about intolerable complexity and hamper the desired agility A systematic approach consisting of anticipative preparing for smooth operation allows mastering this challenge Case studies show that already today this approach enables smart operation of radios realizing impressive efficiency gains without hampering Quality of Service In the future wireless communication scenes will be able to profit from the opening of the spectrum Even smarter and cognitive behavior will become possible and essential

Motorola radio communications buyer's guide Motorola, Inc,1961 *Building a Dynamic Spectrum Access Smart Radio with Application to Public Safety Disaster Communications* Mark D. Silvius,2009 Recent disasters including the 9 11 terrorist attacks Hurricane Katrina the London subway bombings and the California wildfires have all highlighted the limitations of current mobile communication systems for public safety first responders First in a point to point configuration legacy radio systems used by first responders from differing agencies are often made by competing manufacturers and may use incompatible waveforms or channels In addition first responder radio systems which may be licensed and programmed to operate in frequency bands allocated within their home jurisdiction may be neither licensed nor available in forward deployed disaster response locations resulting in an operational scarcity of usable frequencies To address these problems

first responders need smart radio solutions which can bridge these disparate legacy radio systems together can incorporate new smart radio solutions or can replace these existing aging radios These smart radios need to quickly find each other and adhere to spectrum usage and access policies Second in an infrastructure configuration legacy radio systems may not operate at all if the existing communications backbone has been destroyed by the disaster event A communication system which can provide a new temporary infrastructure or can extend an existing infrastructure into a shaded region is needed Smart radio nodes that make up the public safety infrastructure again must be able to find each other adhere to spectrum usage policies and provide access to other smart radios and legacy public safety radios within their coverage area This work addresses these communications problems in the following ways First it applies cognitive radio technology to develop a smart radio system capable of rapidly adapting itself so it can communicate with existing legacy radio systems or other smart radios using a variety of standard and customized waveforms These smart radios can also assemble themselves into an ad hoc network capable of providing a temporary communications backbone within the disaster area or a network extension to a shaded communications area Second this work analyzes and characterizes a series of rendezvous protocols which enable the smart radios to rapidly find each other within a particular coverage area Third this work develops a spectrum sharing protocol that enables the smart radios to adhere to spectral policies by sharing spectrum with other primary users of the band Fourth the performance of the smart radio architecture as well as the performance of the rendezvous and spectrum sharing protocols is evaluated on a smart radio network testbed which has been assembled in a laboratory setting Results are compared when applicable to existing radio systems and protocols Finally this work concludes by briefly discussing how the smart radio technologies developed in this dissertation could be combined to form a public safety communications architecture applicable to the FCC's stated intent for the 700 MHz Band In the future this work will be extended to applications outside of the public safety community specifically to communications problems faced by warfighters in the military
