Snort

Introduction

Snort is the world's most popular Open-Source Intrusion Prevention System (IPS), capable of performing real-time traffic analysis and packet logging on IP networks. Snort IPS uses a series of rules that help define malicious network activity and uses those rules to find packets that match against them and generates alerts for users.

Snort has three primary uses: As a packet sniffer like tcpdump, as a packet logger for network traffic debugging, or it can be used as a full-blown network intrusion prevention system.

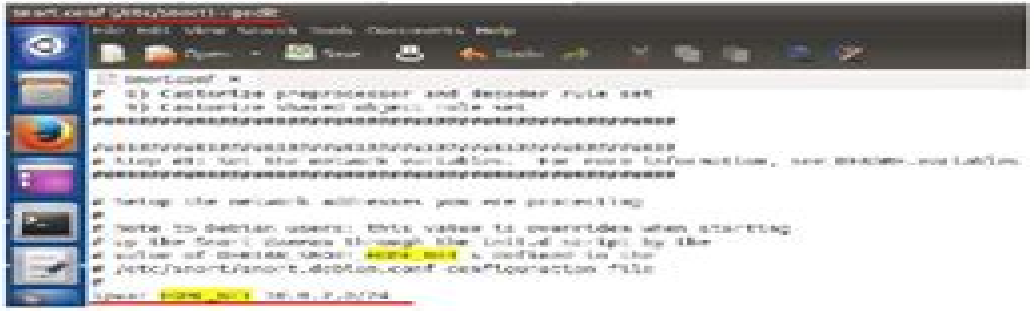
Required resources:

We are going to use **Cybersec-Server**, **Cybersec-Attacker VM** for this lab.

Objective: Configure Snort rules

Step 1: start Snort on Cybersec-Server.

1) Snort is already installed in our system, Snort configuration file is /etc/snort/snort.conf, this is a big configuration file, we will change the ipvar **HOME_NET** from "any" to our local network "10.0.2.0/24" sudo gedit /etc/snort/snort.conf



2) To start Snort:

```
cybersec-server@ubuntu:~$ sudo service snort start
[sudo] password for cybersec-server:
 * Starting Network Intrusion Detection System  snort
cybersec-server@ubuntu:~$
```

3) Check the version of Snort installed.
