The Plant Cytoskeleton: a Key Tool for Agro-Biotechnology Yaroslav B. Blume, W. Vance Baird, Alla I. Yemets, Diego Breviario, 2008-10-23. Essential processes in biology such as cell and nuclear division, development, intracellular transport, and physiological response rely on the perception of environmental and intracellular signals and their transduction to subcellular targets. The mechanisms by which these signals are received by cells and transduced towards the proper targets by cytoskeletal components constitute one of the most important and rapidly developing areas in modern plant biology. In addition, fundamentally important responses of plants to biotic and abiotic factors also involve signalling to and through the cytoskeleton, which helps explain the current interest of biotechnology in this field of fundamental research. Manipulation of cytoskeletal components, the microtubules and microfilaments, had until recently not been a priority issue for plant biotechnology. However, given the fundamental role of the cytoskeleton during plant growth and development, the potential for biotechnological applications is immense. The NATO Advanced Research Workshop The Plant Cytoskeleton: Genomic and Bioinformatic Tools for Biotechnology and Agriculture was held in Yalta, Ukraine, from September 19 to 23, 2006, which continued the tradition of the first two International Symposia Plant Cytoskeleton: Molecular Keys for Biotechnology, Yalta, Ukraine, 1998, and The Plant Cytoskeleton: functional diversity and biotechnological implications, Kiev, Ukraine, 2002.

The key role of ubiquitination and sumoylation in signaling and cancer Hui-Kuan Lin, Wenyi Wei, Ubiquitination and Sumoylation are two important posttranslational modifications that play pivotal roles in a variety of biological functions Although Ubiquitination is traditionally viewed as a critical mark targeting proteins for proteasome dependent degradation recent studies reveal that it also plays nonproteolytic functions In contrast Sumoylation is long thought not to target proteins for degradation accumulating evidence suggests that it can serve a priming effect prerequisite for ubiquitination thereby inducing protein ubiquitination and degradation Thus there is an important cross talk between sumoylation and ubiquitination in determining protein fate Deregulation in these two marks may cause aberrant activity of proteins and in turn contributes to cancer development In this Research Topic we accept review articles perspectives research articles covering any one or both of these two posttranslational modifications in regulating diverse signal transduction pathways and providing the novel insights in unraveling the puzzle as to how they may regulate cancer progression and metastasis
