

Solution Manual for Financial Institutions Management: A Risk Management Approach, 8th Edition

Chapter 01 - Why Are Financial Institutions Special?

Solutions for End-of-Chapter Questions and Problems: Chapter One

1. What are five risks common to all financial institutions?

Default or credit risk of assets, interest rate risk caused by maturity mismatches between assets and liabilities, liability withdrawal or liquidity risk, underwriting risk, and operating risks.

2. Explain how economic transactions between household savers of funds and corporate users of funds would occur in a world without financial institutions.

In a world without FIs the users of corporate funds in the economy would have to directly approach the household savers of funds in order to satisfy their borrowing needs. This process would be extremely costly because of the up-front information costs faced by potential lenders. Cost inefficiencies would arise with the identification of potential borrowers, the pooling of small savings into loans of sufficient size to finance corporate activities, and the assessment of risk and investment opportunities. Moreover, lenders would have to monitor the activities of borrowers over each loan's life span. The net result would be an imperfect allocation of resources in an economy.

3. Identify and explain three economic disincentives that would dampen the flow of funds between household savers of funds and corporate users of funds in an economic world without financial institutions.

Investors generally are averse to directly purchasing securities because of (a) monitoring costs, (b) liquidity costs, and (c) price risk. Monitoring the activities of borrowers requires extensive time, expense, and expertise. As a result, households would prefer to leave this activity to others, and by definition, the resulting lack of monitoring would increase the riskiness of investing in corporate debt and equity markets. The long-term nature of corporate equity and debt securities would likely eliminate at least a portion of those households willing to lend money, as the preference of many for near-cash liquidity would dominate the extra returns which may be available. Finally, the price risk of transactions on the secondary markets would be reduced as the information flows and services generated by high volume.

4. Identify and explain the two functions FIs perform that would enable the flow of funds from household savers to corporate users.
