Numerical Solution of Boundary Value Problems for Ordinary Differential Equations Uri M. Ascher, Robert M. M. Mattheij, Robert D. Russell, 1994-12-01 This book is the most comprehensive up to date account of the popular numerical methods for solving boundary value problems in ordinary differential equations It aims at a thorough understanding of the field by giving an in depth analysis of the numerical methods by using decoupling principles Numerous exercises and real world examples are used throughout to demonstrate the methods and the theory Although first published in 1988 this republication remains the most comprehensive theoretical coverage of the subject matter not available elsewhere in one volume Many problems arising in a wide variety of application areas give rise to mathematical models which form boundary value problems for ordinary differential equations These problems rarely have a closed form solution and computer simulation is typically used to obtain their approximate solution This book discusses methods to carry out such computer simulations in a robust efficient and reliable manner

Boundary Value Problems of Mathematical Physics O. A. Ladyzhenskaya, 1989 Constructive Methods for Linear and Nonlinear

Boundary Value Problems for Analytic Functions v Mityushev, S V Rogosin, 1999-11-29 Constructive methods developed in the framework of analytic functions effectively extend the use of mathematical constructions both within different branches of mathematics and to other disciplines This monograph presents some constructive methods based primarily on original techniques for boundary value problems both linear and nonlinear From among the many applications to which these methods can apply the authors focus on interesting problems associated with composite materials with a finite number of inclusions How far can one go in the solutions of problems in nonlinear mechanics and physics using the ideas of analytic functions What is the difference between linear and nonlinear cases from the qualitative point of view What kinds of additional techniques should one use in investigating nonlinear problems Constructive Methods for Linear and Nonlinear Boundary Value Problems serves to answer these questions and presents many results to Westerners for the first time Among the most interesting of these is the complete solution of the Riemann Hilbert problem for multiply connected domains The results offered in Constructive Methods for Linear and Nonlinear Boundary Value Problems are prepared for direct application A historical survey along with background material and an in depth presentation of practical methods make this a self contained volume useful to experts in analytic function theory to non specialists and even to non mathematicians who can apply the methods to their research in mechanics and physics

Elementary Differential Equations and Boundary Value Problems William E. Boyce, Richard C. DiPrima, Douglas B. Meade, 2017-08-21 Elementary Differential Equations and Boundary Value Problems 11e like its predecessors is written from the viewpoint of the applied mathematician whose interest in differential equations may sometimes be quite theoretical sometimes intensely practical and often somewhere in between The authors have sought to combine a sound and accurate but not abstract exposition of the elementary theory of differential equations with considerable material on methods of solution analysis and approximation that have proved useful in a wide variety of applications While the general structure of the book remains unchanged some notable changes have been made to improve the clarity and readability of basic material about differential equations and their applications In addition to expanded explanations the 11th edition includes new problems updated figures and examples to help motivate students The program is primarily intended for undergraduate students of mathematics science or engineering who typically take a course on differential equations during their first or second year of study The main prerequisite for engaging with the program is a working knowledge of calculus gained from a normal two or three semester course sequence or its equivalent Some familiarity with matrices will also be helpful in the chapters on systems of differential equations
