

Solving Equations

Many algebra problems are actually based on being comfortable in using equal unknown quantities, or equations, as a statement that the quantities involved are the same as quantities that cannot change (the unknowns) while creating statements that represent the actual situation. For example, if a car travels 60 miles per hour for 3 hours, it will travel 180 miles. This is a simple equation: $60 \times 3 = 180$.

While there are many properties of real numbers and properties of equations that are true, there are a few properties that help us solve equations.

Basic Properties of Equations

Substitution property

If two quantities differ and one quantity is equal to a third quantity, the second quantity is equal to the third quantity.

$$\text{If } a = b \text{ and } b = c, \text{ then } a = c.$$

Substitution property

$$\text{If } a = b, \text{ then } a \text{ can be replaced by } b.$$

If two equations are true and the substitution property is used, the resulting equation will be true. For example, if $a = b$ and $b = c$, then $a = c$.

$$\text{If } a = b \text{ and } b = c, \text{ then } a = c.$$

Properties of Equations

Addition property

$$\text{If } a = b, \text{ then } a + c = b + c.$$

Subtraction property

$$\text{If } a = b, \text{ then } a - c = b - c.$$

If two quantities differ and one quantity is equal to a third quantity, the second quantity is equal to the third quantity.

Substitution property

$$\text{If } a = b, \text{ then } a \text{ can be replaced by } b \text{ in any equation.}$$

If two quantities differ and one quantity is equal to a third quantity, the second quantity is equal to the third quantity. For example, if $a = b$ and $b = c$, then $a = c$.

Multiplication property

$$\text{If } a = b, \text{ then } ac = bc.$$

Division property

$$\text{If } a = b, \text{ then } \frac{a}{c} = \frac{b}{c} \text{ (provided } c \neq 0 \text{).}$$
