Slinky Wave Lab

Background

A wave can be described as an energy disturbance that travels through a medium from one location to another. Waves, simply put, are **energy moving** from one place to another. As the wave moves through the **medium** (water, slinky, air), energy is being passed from one particle to the next. Waves occur around us every day. Some common places we experience waves are in sound, light, water, and earthquakes.

In addition to being a great toy, the Slinky is an excellent device for creating and studying waves. A slinky can easily demonstrate the two basic types of waves, longitudinal and transverse. In a longitudinal wave the particles move parallel to the direction the wave is moving. In a transverse wave the particles move at right angles to the direction of wave travel.

There are three basic characteristics used to describe waves.

- Frequency The number of waves produced in a given time period. This is usually measured in waves per second called Hertz (Hz).
- Wavelength The length of a wave. This can be measured easily from crest to crest or from trough to trough.
- Amplitude The height or depth of a wave. The amount of energy carried by a
 wave is related to amplitude. A high energy wave is characterized by high
 amplitude; a low energy wave by low amplitude.
