

Transient absorption Manual

1/ Principle of transient absorption technique

Transient absorption (TA) spectroscopy is the pump-probe technique which monitors the carrier dynamics of materials.

** By using two pulses, including the pump pulse for exciting the samples and the weaker following probe pulse, we can monitor the differential transmission (or transmittance) change ($\Delta T/T = (T_{\text{on}} - T_{\text{off}})/T_{\text{off}}$) via time delay between pump and probe pulses, where T_{on} and T_{off} are the probe transmission with and without a pump.

** The photo-induced bleaching (PIB) represents the specific resonant inter-band transitions, while the photo-induced absorption (PIA) indicates intra-band excitation of photo-generated free carriers.

+ If we get the positive of differential transmission ($\Delta T/T > 0$ or $\Delta A/A < 0$), we called photobleaching (PB)

+ If the differential transmission is negative ($\Delta T/T < 0$ or $\Delta A/A > 0$), we will get the photo-induced absorption (PIA) as shown below:
