Emerging Solutions for Future Manufacturing Systems Luis M. Camarinha-Matos, 2006-01-04 Industries and particularly the manufacturing sector have been facing difficult challenges in a context of socio economic turbulence characterized by complexity as well as the speed of change in causal interconnections in the socio economic environment In order to respond to these challenges companies are forced to seek new technological

and organizational solutions In this context two main characteristics emerge as key properties of a modern automation system agility and distribution Agility because systems need not only to be flexible in order to adjust to a number of a priori defined scenarios but rather must cope with unpredictability Distribution in the sense that automation and business processes are becoming distributed and supported by collaborative networks Emerging Solutions for Future Manufacturing Systems includes the papers selected for the BASYS 04 conference which was held in Vienna Austria in September 2004 and sponsored by the International Federation for Information Processing IFIP

Python Algorithms Magnus Lie Hetland, 2014-09-17 Python Algorithms Second Edition explains the Python approach to algorithm analysis and design Written by Magnus Lie Hetland author of Beginning Python this book is sharply focused on classical algorithms but it also gives a solid understanding of fundamental algorithmic problem solving techniques The book deals with some of the most important and challenging areas of programming and computer science in a highly readable manner It covers both algorithmic theory and programming practice demonstrating how theory is reflected in real Python programs Well known algorithms and data structures that are built into the Python language are explained and the user is shown how to implement and evaluate others

Automatic Design of Decision-Tree Induction Algorithms Rodrigo C. Barros, André C.P.L.F de Carvalho, Alex A. Freitas, 2015-02-04 Presents a detailed study of the major design components that constitute a top down decision tree induction algorithm including aspects such as split criteria stopping criteria pruning and the approaches for dealing with missing values Whereas the strategy still employed nowadays is to use a generic decision tree induction algorithm regardless of the data the authors argue on the benefits that a bias fitting strategy could bring to decision tree induction in which the ultimate goal is the automatic generation of a decision tree induction algorithm tailored to the

application domain of interest For such they discuss how one can effectively discover the most suitable set of components of decision tree induction algorithms to deal with a wide variety of applications through the paradigm of evolutionary computation following the emergence of a novel field called hyper heuristics Automatic Design of Decision Tree Induction Algorithms would be highly useful for machine learning and evolutionary computation students and researchers alike
