

Primary data

Data is all the information and measurements that are collected by scientists from textbooks, encyclopedias, journals and the internet, or from carrying out their own investigations. Scientists collect data and organise it into tables and graphs. They analyse the data, draw conclusions from it and then write it all up so that other scientists can understand it.

Internet reaction times

How fast can you react?

Do this ...

- 1 Use the key words *reflex tester* or *reaction time* in your internet search engine to find interactive games that will measure your reaction time.
- 2 Although most of the games involve detecting a change in colour of the web page, some shoot tranquiliser darts into sheep while in others you play baseball! Try as many as you can to determine your average reaction time.

Record this ...

- 1 Describe what happened.
- 2 Explain why you think this happened.

Data

Data is the term given to all the observations and measurements that can be used to describe something. For example, you can be described by your personal data. This includes your height and weight, your hair, skin and eye colour, when and where you were born, the names of your parents and distinguishing features such as a scar or birthmark. Data on the parrot in Figure 1.1.1 would include its colour, sex, body temperature and the type of nest it makes.

FIGURE 1.1.1 Data on this parrot would include its size and mass, the environment it lives in, the number of tail feathers it has, the average number of eggs it lays and the age at which it first flies.

[Modern Statistics for the Social and Behavioral Sciences](#) Rand Wilcox, 2011-08-05 In addition to learning how to apply classic statistical methods students need to understand when these methods perform well and when and why they can be highly unsatisfactory Modern Statistics for the Social and Behavioral Sciences illustrates how to use R to apply both standard and modern methods to correct known problems with classic techniques Numerous illustrations provide a conceptual basis for understanding why practical problems with classic methods were missed for so many years and why modern techniques have practical value Designed for

a two semester introductory course for graduate students in the social sciences this text introduces three major advances in the field Early studies seemed to suggest that normality can be assumed with relatively small sample sizes due to the central limit theorem However crucial issues were missed Vastly improved methods are now available for dealing with non normality The impact of outliers and heavy tailed distributions on power and our ability to obtain an accurate assessment of how groups differ and variables are related is a practical concern when using standard techniques regardless of how large the sample size might be Methods for dealing with this insight are described The deleterious effects of heteroscedasticity on conventional ANOVA and regression methods are much more serious than once thought Effective techniques for dealing heteroscedasticity are described and illustrated Requiring no prior training in statistics Modern Statistics for the Social and Behavioral Sciences provides a graduate level introduction to basic routinely used statistical techniques relevant to the social and behavioral sciences It describes and illustrates methods developed during the last half century that deal with known problems associated with classic techniques Espousing the view that no single method is always best it imparts a general understanding of the relative merits of various techniques so that the choice of method can be made in an informed manner

Error and the Growth of Experimental Knowledge Deborah G. Mayo, 1996-07-17 We may learn from our mistakes but Deborah Mayo argues that where experimental knowledge is concerned we haven't begun to learn enough *Error and the Growth of Experimental Knowledge* launches a vigorous critique of the subjective Bayesian view of statistical inference and proposes Mayo's own error statistical approach as a more robust framework for the epistemology of experiment Mayo genuinely addresses the needs of researchers who work with statistical analysis and simultaneously engages the basic philosophical problems of objectivity and rationality Mayo has long argued for an account of learning from error that goes far beyond detecting logical inconsistencies In this book she presents her complete program for how we learn about the world by being shrewd inquirers of error white gloves off Her tough practical approach will be important to philosophers historians and sociologists of science and will be welcomed by researchers in the physical biological and social sciences whose work depends upon statistical analysis
