Combinational Logic Design

Objectives:

1. Design procedure.
2. Fundamental circuits.

1. Design procedure

- Design procedure has five steps:
 - *Specification.*
 - *Formulation.*
 - *Optimization.*
 - *Technology mapping.*
 - *Verification.*
- **Specification:**
The design of a combinational circuit starts with the specification of the problem:
Write a specification for the given circuit (text or HDL description (hardware description language)) with symbols for inputs and outputs.
- **Formulation:**
Derive the truth table or initial Boolean expressions (that define the required relationships between inputs and outputs).
Formulation converts the specification into forms that can be optimized (truth table or Boolean expression).
- **Optimization:**
 - Any available methods to minimize the logic:
 - ✓ **Algebraic manipulation.**
 - ✓ **K-map method.**
 - ✓ **Computer-based program.**
 - Then, we can use:**
 - ✓ **Two-level optimization or multiple-level optimization to get less cost (use NAND and NOR gate technologies).**
- **Technology mapping (implementation):**
Transform the logic diagram to new logic diagram with available implementation.
- **Verification:**
Verify the correctness of the final design.
