Light

Name:

TUTORIAL A

Visible light is the only part of the electromagnetic spectrum that our eyes can detect.

- 1 Most of the electromagnetic spectrum is invisible. The only part of it that our eyes can detect is called visible _____. Light can travel through empty space; it doesn't need a medium (material) to travel through.
- 2 Light is made up of waves that do not need a _____ (material) to travel through. It can also pass through any medium that is transparent (that we can see through). Its speed, however, is then reduced. In a vacuum, light travels at 300 000 km/s, but it slows down to 226 000 km/s in water and 200 000 km/s in glass. When it passes through a crystal of diamond, it slows down to 125 000 km/s. This ability to slow the passage of light is what makes diamonds sparkle.
- 3 A medium that we can see through is described as _____. Light sparkles most through the gemstone _____, because it _____ down the speed of light so much.
- 4 Light travels at _____ km/s through diamond, _____ km/s through glass and _____ km/s through water. It travels fastest through a vacuum (_____ km/s), and nothing can travel faster than that.
- 5 Nothing can travel faster than _____ through a _____. Other transparent _____, however, slow light down. An interface is a boundary between two different media.
- 6 When a light ray reaches a boundary between two different media (an _____), it does not just stop. If both media are transparent and if the light strikes at any angle other than 90°, the light ray changes direction (it is refracted). Some transparent materials refract light more than others, because they slow it down more.
- 7 When light travels from one transparent medium to a different one, it is refracted (it changes _____).
