Section on Diseases of Children,1926 Multifunctional Lightweight Structures Lothar Kroll,2023-03-28 This book presents key research findings on the combination of different technologies that promise to be particularly sustainable and broadly impactful in their application The findings were compiled during the course of the first funding period for the MERGE Cluster of Excellence New methods potential solutions and exemplary pilot applications take center stage as the text explores the next generation of functional integration via lightweight structures The underlying manufacturing processes are based on textile polymer and metal processing techniques all of which are suitable for large batch production flexibility and reproducibility *Meeting the Physical Therapy Needs of Children* Susan K Effgen,2012-09-12 Ensure children with disabilities and special healthcare needs achieve their full potential Noted authority Susan Effgen and a team of scholars and clinical experts explore the role of the physical therapist in meeting the needs of children and their families in a culturally appropriate context using a family centered abilities based model The 2nd Edition of this landmark text has been thoroughly revised updated and expanded to encompass all of today s new theories clinical applications and skills From the major body systems to assistive technology and intervention support you ll develop the clinical knowledge you need to provide a child with the very best care from initial examination to graduation from your services **Cellular and molecular mechanisms of motor neuron death in amyotrophic lateral sclerosis** Ricardo Tapia,2015-02-11 Amyotrophic lateral sclerosis ALS which was described since 1869 by Jean Martin Charcot is a devastating neurodegenerative disease characterized by the selective and progressive loss of upper and lower motor neurons of the cerebral cortex brainstem and the spinal cord The cognitive process is not affected and is not merely the result of aging

because may occur at young ages The only known cause of the disease is associated with genetic mutations mainly in the gene encoding superoxide dismutase 1 familial ALS whereas there is no known cause of the sporadic form of ALS SALS which comprises 90% of cases Both ALS types develop similar histopathological and clinical characteristics and there is no treatment or prevention of the disease Because effective treatments for ALS as for other neurodegenerative diseases can only result from the knowledge of their cellular and molecular pathophysiological mechanisms research on such mechanisms is essential Although progress in neurochemical physiological and clinical investigations in the last decades has identified several mechanisms that seem to be involved in the cell death process such as glutamate mediated excitotoxicity alterations of inhibitory circuits inflammatory events axonal transport deficits oxidative stress mitochondrial dysfunction and energy failure the understanding of the origin and temporal progress of the disease is still incomplete and insufficient Clearly there is a need of further experimental models and approaches to discern the importance of such mechanisms and to discover the factors that determine the selective death of motor neurons characteristic of ALS in contrast to other neurodegenerative diseases such as Parkinson s and Alzheimer s disease Whereas studies in vitro in cell cultures tissue slices or organotypic preparations can give useful information regarding cellular and molecular mechanisms the experiments in living animal models obviously reflect more closely the situation in the human disease provided that the symptoms and their development during time mimics as close as possible those of the human disease It is necessary to correlate the experimental findings in vitro with those in vivo as well as those obtained in genetic models with those in non genetic models aiming at designing and testing therapeutic strategies based on the results obtained
