Channel-conveyance capacity, channel change, and sediment transport in the lower Puyallup, White, and Carbon Rivers, western Washington Jonathan A. Czuba, Christiana R. Czuba, Christopher S. Magirl, Frank D. Voss, 2010-12-01 Draining the volcanic glaciated terrain of Mount Rainier Washington the Puyallup White and Carbon Rivers convey copious volumes of water and sediment down to Commencement Bay in Puget Sound Recent flooding in the lowland river system has renewed interest in understanding sediment transport and its effects on flow conveyance throughout the lower drainage basin Bathymetric and topographic data for 156 cross sections were surveyed in the lower Puyallup River system by the U S Geological Survey USGS and were compared with similar datasets collected in 1984 Regions of significant aggradation were measured along the Puyallup and White Rivers Between 1984 and 2009 aggradation totals as measured by changes in average channel elevation were as much as 7 5 6 5 and 2 feet on the Puyallup White and Carbon Rivers respectively These aggrading river sections correlated with decreasing slopes in riverbeds where the rivers exit relatively confined sections in the upper drainage and enter the relatively unconstricted valleys of the low gradient Puget Lowland Measured grain size distributions from each riverbed showed a progressive fining downstream Analysis of stage discharge relations at streamflow gaging stations along rivers draining Mount Rainier demonstrated the dynamic nature of channel morphology on river courses influenced by glaciated volcanic terrain The greatest rates of aggradation since the 1980s were in the Nisqually River near National 5 0 inches per year and the White River near Auburn 1 8 inches per year Less pronounced aggradation was measured on the Puyallup River and the White River just downstream of Mud Mountain Dam The largest measured rate of incision was measured in the Cowlitz River at Packwood 5 0 inches per year Channel conveyance capacity estimated using a one dimensional hydraulic model decreased in some river reaches since 1984 The reach exhibiting the largest decrease about 20 50 percent in channel conveyance capacity was the White River between R Street Bridge and the Lake Tapps return a reach affected by recent flooding Conveyance capacity also decreased in sections of the Puyallup River Conveyance capacity was mostly unchanged along other study reaches Bedload transport was simulated throughout the entire river network and consistent with other observations and analyses the hydraulic model showed that the upper Puyallup and White Rivers tended to accumulate sediment Accuracy of the bedload transport modeling however was limited due to a scarcity of sediment transport data sets from the Puyallup system mantling of sand over cobbles in the lower Puyallup and White Rivers and overall uncertainty in modeling sediment transport in gravel bedded

rivers Consequently the output results from the model were treated as more qualitative in value useful in comparing geomorphic trends within different river reaches but not accurate in producing precise predictions of mass of sediment moved or deposited The hydraulic model and the bedload transport component were useful for analyzing proposed river management options if surveyed cross sections adequately represented the river management site and proposed management options The hydraulic model showed that setback levees would provide greater flood protection than gravel bar scalping after the initial project construction and for some time thereafter although the model was not accurate enough to quantify the length of time of the flood protection The greatest hydraulic benefit from setback levees would be a substantial increase in the effective channel conveyance area By widening the distance between levees the new floodplain would accommodate larger increases in discharge with relatively small incremental increases in stage Model simulation results indicate that the hydraulic benefit from a setback levee also would be long lived and would effectively compensate for increased deposition within the setback reach from increased channel conveyance capacity In contrast the benefit from gravel bar scalping would be limited by the volume of material that could be removed and the underlying hydraulics in the river section that would be mostly unaffected by scalping Finally the study formulated an explanation of the flooding that affected Pacific Washington in January 2009 Reduction in channel conveyance capacity of about 25 percent at the White River near Auburn streamflow gaging station between November 2008 and January 2009 was caused by rapid accumulation of coarse grained sediment just downstream of the gage continuing an ongoing trend of aggradation that has been documented repeatedly **ACSM Bulletin** ,1998 **Canadian Journal of Forest Research** ,2011 *Surveying Instruments and Technology* Leonid Nadolnits, Eugene Levin, Daulet Akhmedov, 2017-07-06 With the advent of GPS GNSS satellite navigation systems and Unmanned Aerial Systems UAS surveying profession is nowadays facing its transformative stage Written by a team of surveying experts *Surveyor's Instruments and Technology* gives surveying students and practitioners profound understanding of how surveying instruments are designed and operating based on surveying instrument functionality The book includes the required basic knowledge of accurate measurements of distances and angles from theoretical principles to advanced optical mechanical electronic and software components for comparative analysis Readers are presented with basic elements of UAS systems practical interpretation techniques sensor components and operating platforms Appropriate for surveying courses at all levels this guide helps students and practitioners alike to understand what is behind the buttons of surveying instruments of all kinds when considering practical project implementations **World Highways** ,2005 *Surveying* Barry F. Seascape Ecology: from characterization to evaluation of state and change over time Monica Montefalcone, Carlo Nike Bianchi, 2023-08-22

Landscape ecology has been a discrete established discipline since at least 1980 Its marine counterpart seascape ecology is barely a decade old its first applications dating from the early 2010s Lack of perception of the marine environment hampers the adoption of many landscape ecology approaches to the sea Seascape ecology relies on special technologies such as remote sensing either acoustic or optical robotics and scuba diving Both disciplines deal with the spatial configuration of ecosystems and consider environmental heterogeneity and dynamics as the main subjects of study and the key for ecosystem functioning and persistence Seascape is here intended as the totality of natural and anthropogenic characters of a marine region To the geologist it is defined by sedimentology and underwater geomorphology to the biologist by the nature of the living cover of the seafloor to the ecologist by the relationships among functional processes and the spatial organization of ecosystems The goal of this research topic is to encourage original research case studies reviews and viewpoints to identify research priority gaps and possibly contribute to filling them in We will appreciate in particular manuscripts dealing with recent advances such as high resolution habitat mapping underwater soundscape and biophony development application and validation of biotic indices to assess seafloor integrity as requested for instance by recent European Directives Papers of interest may discuss the multivarious facets of stability and describe resistance and resilience patterns the role of stress and

disturbance regime shift and phase shift or may take up the challenge of integrating coastal landscape and seascape analyses Studies of long term series are welcome as well as methodological improvements and macroecological approaches on the importance of species diversity and connectivity in seascape organization *Successful Field-to-office Automation* Alan W. Roth,1990 **Geomatica** ,2000 *A GPS User Manual* Dale Depriest,2003 This manual is a complete user manual for Garmin handheld receivers It covers theory and practical applications for gps technology and the receivers that use this technology Representative products for all of the Garmin handheld receivers past and present are explained and tips are given on getting the most out of each model It is designed to augment the user manuals that are supplied with each product but is complete enough to replace them While this manual is Garmin specific it provides a basic understanding of gps devices that is applicable to any gps receiver It was written over a period of 4 years and has been reviewed and tested by hundreds of users over that period It has been used as the reference for training on gps usage Because of its unique approach that develops the theory behind operation as well as specific details it provides a basis that will allow a user to be able to use any gps receiver Skills in the use of a gps will provide assurance and safety for the user Topics extend beyond just operating the unit to actually being able to use it for navigation on the land in the sea or in the air Topics are applicable whether you are hiking or driving to your destination These topics include product operation waypoints routes tracklogs navigation maps and databases product selection features theory accessories and product unique functions *The GPS Manual* Steve Dye, Frank Baylin,1997 **JEWEL, GPS (Graphical Presentation System)** Georg Jünger,Reiner Kraft,Brigitte Schmidt,1992 **HALO_GPS Software User Manual** Qianxin Wang,Tianhe Xu,Guochang Xu,2010
