However, consumer interaction with such equipment currently requires the use of devices such as remote controls and keyboards which are often inconvenient, ambiguous, and non-interactive. An important challenge for the modern CE industry is the design of user interfaces for CE products that enable interactions which are natural, intuitive, and fun. As many CE products are supplied with microphones and cameras, the exploitation of both audio and visual information for interactive multimedia is a growing field of research. Collecting together contributions from an international selection of experts including leading researchers in industry, this unique text presents the latest advances in applications of multimedia interaction and user interfaces for consumer electronics. Covering issues of both multimedia content analysis and human-machine interaction, the book examines a wide range of techniques from computer vision, machine learning, audio and speech processing, communications, artificial intelligence, and media technology. Topics and features include: novel computationally efficient algorithms to extract semantically meaningful audio-visual events; investigates modality allocation in intelligent multimodal presentation systems; taking into account the cognitive impacts of modality on human information processing; provides an overview on gesture control technologies for CE; presents systems for natural human-computer interaction; virtual content insertion and human action retrieval; examines techniques for 3D face pose estimation, physical activity recognition, and video summary quality evaluation; discusses the features that characterize the new generation of CE and examines how web services can be integrated with CE products for improved user experience. This book is an essential resource for researchers and practitioners from both academia and industry working in areas of multimedia analysis, human-computer interaction, and interactive user interfaces. Graduate students studying computer vision, pattern recognition, and multimedia will also find this a useful reference. Wireless Internet Handbook Borko Furht, Mohammad Ilyas, 2003-03-28 Wireless applications are definitely the next big thing in communications. Millions of people around the world use the Internet every day to stay in touch with remote locations, follow the stock market, keep up with the news, check the weather, make travel plans, conduct business, shop, entertain themselves, and learn. The logical next step is the development of the wireless Internet where cell phones, PDAs, and laptops let us receive and send e-mails and perform all the activities that we are currently performing over the wireline Internet. Filled with contributions from international experts, Wireless Internet Handbook: Technologies, Standards, and Applications describes basic concepts, current developments, and future trends in designing modern architectures. The book covers: Wireless local access techniques to the mobile Internet; User mobility in IP networks; Multimedia streaming over wireless Internet; Quality of service issues; Location management techniques and clustering architectures; Wireless Internet security issues; Bluetooth, CDMA, TDMA; Wireless Application Protocol 802.11x and more.

Different mobile and wireless Internet services Wireless Internet enterprise applications Mobile multimedia and graphics applications Mobile video telephony Wireless video surveillance Wireless applications in medicine The scope of the information covered and the expertise of leading researchers and industry professionals combine to make Wireless Internet Handbook Technologies Standards and Applications the definitive resource on current and future trends in designing modern architectures for the wireless Internet
