Tomtom 2050 User Manual:

EU Competition Law and the Information and Communication Technology Network Industries Andrej Fatur, 2012-03-08
Competition policies have long been based on a scholarly tradition focused on static models and static analysis of industrial organisation. However, recent developments in industrial organisation literature have led to significant advances moving beyond traditional static models and a preoccupation with price competition to consider the organisation of industries in a dynamic context. This is especially important in the field of information and communication technology (ICT) network industries where competition centres on network effects, innovation and intellectual property rights and where the key driver of consumer benefit is technological progress. Consequently, when an antitrust intervention is contemplated, a number of considerations that arise out of the specific nature of the ICT sector have to be taken into account to ensure improved consumer welfare. This book considers the adequacy of existing EU competition policy in the area of the ICT industries in the light of the findings of modern economic theory. Particular attention is given to the implications of these dynamic markets for the competitive assessment and treatment of the most common competitive harms in this area such as non-price predatory practices, tying and bundling, co-operative standard setting, platform joint ventures and co-operative R D.

Autonomous Driving Markus Maurer, J. Christian Gerdes, Barbara Lenz, Hermann Winner, 2016-05-21
This book takes a look at fully automated autonomous vehicles and discusses many open questions. How can autonomous vehicles be integrated into the current transportation system with diverse users and human drivers? Where do automated vehicles fall under current legal frameworks? What risks are associated with automation and how will society respond to these risks? How will the marketplace react to automated vehicles and what changes may be necessary for companies? Experts from Germany and the United States define key societal engineering and mobility issues related to the automation of vehicles. They discuss the decisions programmers of automated vehicles must make to enable vehicles to perceive their environment, interact with other road users and choose actions that may have ethical consequences. The authors further identify expectations and concerns that will form the basis for individual and societal acceptance of autonomous driving. While the safety benefits of such vehicles are tremendous, the authors demonstrate that these benefits will only be achieved if vehicles have an appropriate safety concept at the heart of their design. Realizing the potential of automated vehicles to reorganize traffic and transform mobility of people and goods requires similar care in the design of vehicles and networks. By covering all of these topics, the book aims to provide a current, comprehensive and scientifically sound treatment of the emerging field of autonomous driving.

The Man who Loved Children Christina Stead, 1995
After ten years of marriage, Sam and Henny Pollit find themselves with too many children, insufficient money and an abundant loathing for each other.
