Sedimentology of Aqueous Systems Cristiano Poletto, Susanne M. Charlesworth, 2010-02-05 Sediments in aqueous systems are of increasing interest to academics researchers practitioners and stakeholders around the world This book not only covers the characteristics of the sediments themselves but also their physico chemical impact on aquatic habitats and subsequent management implications There is a strong focus on methods and instrumentation for collecting data and monitoring of environmental sediment quality and as a result a wide range of environments are considered from urban areas to freshwater estuaries and marine ecosystems The chapters have been written by international specialists in the field ensuring a good breadth of examples experiences and case studies throughout This book will appeal to a broad spectrum of interests from geographers to engineers and environmental scientists and at undergraduate to post graduate and academic researcher levels

Carcinogenesis and Mutagenesis Testing J. F. Douglas, 2012-12-06 Cancer has become the most critical health problem in the United States It is expected that 25% of the people will develop this dread disease and many of these will die from the malady The causes of cancer are varied but the best estimate available is that 70 90% arise from environmental factors These statistics have triggered widespread governmental action along two lines 1 An effort to identify those chemicals and conditions that give rise to malignant processes has been mounted by the Carcino genesis Testing Program the National Cancer Program and subsequently the National Toxicology Program 2 Regulatory laws have been enacted that are administered by agencies such as TSCA FIFRA EPA FDA OSHA and so on whose mission is to minimize public exposure to carcinogens Since direct verification that specific chemicals induce cancer in humans is necessarily limited to known incidences sure and is therefore rare most chemicals are identified as carcinogens only by laboratory experiments At present the only accepted procedure is long term animal bioassay and not only are these studies expensive and time consuming but current worldwide resources permit the evaluation of only 300 400 chemicals per year a miniscule amount compared to what is available in the commercial world 30 000 existing chemicals with approximately 700 new such materials being introduced every year
