Microbiology: The study of living things too small to see with the naked eye

- · The four main divisions of life are bacteria, arches, enkargeta, and viruses
 - Each division's DNA is more similar to its own than to any of the other three

Bacteria:

- · Were the first cells on Earth.
- Contain over 50 different phyla (major groupings).
- . Are the most abundant form of life
- . People have more bacteria growing on in them than human cells
- Incredibly diverse.
 - There are thousands of different species in one gram of soil
- Live in most environments, including the deep sea, underground, and terrestrial

Archaea

- Relatively secommon with fewer known species
- . Most common in extreme environments (e.g., deep sea vents and high salinity lakes)
- Combine some features of prokaryotes and enkaryotes
- Often known as extremophiles and will grow when other organisms cannot.

EX: Halophiles, soft loving; sulfophiles, sulfor loving; thermotroph, best loving; lithotroph, rock loving; methanophile, methane loving (ruminant gats)

Eukaryotes

- May be single cells (e.g., yeast, algae, and amorbas) or multicellular (e.g., fungi, plants, and animals)
 - Contain moreheuse-bound subcompartments that separate specific functions, particularly the mucleus
 - Division includes microscopic organisms previously belonging to the Moneta kingdom

Wilnuses.

- Many feel viruses are not alive as they are obligate parasites and cannot replicate without other cells.
- Different viruses target all those domains
- Viruses may use DNA or RNA is genetic material and use molecules from the host cell to make more virus particles, ultimately killing the host

Shapes & Types //

Bacterial & Archeal Cell Shapes & Growth Characteristics

- · Coccis Sphorical
- · Barillis Rod-shaped
- Spirittic Spiral-shaped
- Plessmorphies Multiple shapes are possible.

- Biple-1 Prefix meaning two; a alphococcus in two cocci that have grown together
- Tetrads Four cocci that grow together in a plane
- Sarchase: Eight cooci that grow together in a cube.
- Strepto-: Prefix meaning chain; a streptococcus is cocci that have grown together in a chain
- Staphylo-r Prefix meaning cluster; a staphylococcur is cocci that have goven topolicy in a cluster

Eukaryotic Types

- Ciliate: Short cilia used for locomotion and/or feeding.
- Flagellate: Long flagella used for locomotion; usually there are only one or two per cell
- Slime model: Single cells living in a damp environment (e.g., under leaves in a forest) that come together during replication

- Amorbic Free-form cell that can change its shape and engulf its prey
- Pretist: Non-plant, non-fungi organism (e.g., ciliates and flagellates)
- Algae: Photosymthetic organism with a model and chloroplasts. Many are single cells, others are multicellular, but many forms are still microscopic (i.e., volvox)
- Diatoms Photosynthesic cukaryote with a silicate cell wall often with a complex symmetrical pattern
- · Yeast: Eukaryotic, single-celled, round fungi-
- Mold: Multicellular fungus which forms hair-like projections (hyphae) that may contain consenally (septate) or not (cornecytle)

Viral Shapes

Helical: Spiral arrangement of protein capsid molecules that can appear rod-shaped
