Willmot, 2014-08-21 Student Solutions Manual to Accompany Loss Models From Data to Decisions Fourth Edition This volume is organised around the principle that much of actuarial science consists of the construction and analysis of mathematical models which describe the process by which funds flow into and out of an insurance system *Subject Guide to Books in Print*, 1996 **Statistical Group Comparison** Tim Futing Liao, 2011-09-20 An incomparably useful examination of statistical methods for comparison The nature of doing science be it natural or social inevitably calls for comparison Statistical methods are at the heart of such comparison for they not only help us gain understanding of the world around us but often define how our research is to be carried out The need to compare between groups is best exemplified by experiments which have clearly defined statistical methods However true experiments are not always possible What complicates the matter more is a great deal of diversity in factors that are not independent of the outcome Statistical Group Comparison brings together a broad range of statistical methods for comparison developed over recent years The book covers a wide spectrum of topics from the simplest comparison of two means or rates to more recently developed statistics including double generalized linear models and Bayesian as well as hierarchical methods Coverage includes Testing parameter equality in linear regression and other generalized linear models GLMs in order of increasing complexity Likelihood ratio Wald and Lagrange multiplier statistics examined where applicable Group comparisons involving latent variables in structural equation modeling Models of comparison for categorical latent variables Examples are drawn from the social political economic and biomedical sciences many can be implemented using widely available software Because of the range and the generality of the statistical methods covered researchers across many disciplines beyond the social political

Experiments Ajit C. Tamhane, 2009-04-06 A indispensable guide to understanding and designing modern experiments. The tools and techniques of Design of Experiments (DOE) allow researchers to successfully collect, analyze and interpret data across a wide array of disciplines. Statistical Analysis of Designed Experiments provides a modern and balanced treatment of DOE methodology with thorough coverage of the underlying theory and standard designs of experiments, guiding the reader through applications to research in various fields such as engineering, medicine, business and the social sciences. The book supplies a foundation for the subject, beginning with basic concepts of DOE and a review of elementary normal theory statistical methods. Subsequent chapters present a uniform model based approach to DOE. Each design is presented in a comprehensive format and is accompanied by a motivating example, discussion of the applicability of the design and a model for its analysis using statistical methods such as graphical plots, analysis of variance (ANOVA), confidence intervals and hypothesis tests. Numerous theoretical and applied exercises are provided in each chapter and answers to selected exercises are included at the end of the book. An appendix features three case studies that illustrate the challenges often encountered in real world experiments such as randomization, unbalanced data and outliers. Minitab software is used to perform analyses throughout the book and an accompanying FTP site houses additional exercises and data sets. With its breadth of real world examples and accessible treatment of both theory and applications, Statistical Analysis of Designed Experiments is a valuable book for experimental design courses at the upper undergraduate and graduate levels. It is also an indispensable reference for practicing statisticians, engineers and scientists who would like to further their knowledge of DOE.
